Leopold, Luna B., "Ethos, Equity, and the Water Resource," Environment, March 1990, pp.16-20, 37-42. An address given February 15, 1990, the Abel Wolman Distinguished Lecture, sponsored by the Water Science and Technology Board of the U. S. National Academy of Sciences, in Washington. "The proliferation of public agencies dealing with water has led to a dissassociation of their policies, their procedures, and their outlook from the operational health of the hydrologic system." "It is deplorable that the government agency most responsible for managing water in water-short regions continues to be so insensistive to the hydrologic continuum and to equity among claimants." "The resource establishment, especially in the field of water, is stuck on the shoals of special interests, a lack of long-term perspective, and a shortage of public-minded leadership." (v1,#3)

Lercher Aaron, "Are There Any Environmental Rights?" *Environmental Values* 16(2007):355-368. This paper extends the argument in H.L.A. Hart's 'Are there any natural rights?' to argue that there is an environmental moral right against pollution. This right is composed of a right against negligent, reckless or intentional risk imposition, together with the liberty to act in a way that does not negligently, recklessly or intentionally impose risks on others. This right is understood as overrideable or prima facie, and this paper does not claim that this right is the only basis of moral judgment in the cases it considers. The hypothesis that there is a right against pollution does, however, explain some moral reasoning about pollution that otherwise is difficult to explain. Lercher is at Louisiana State University, Baton Rouge, LA.

Lercher, Aaron. "Liberty of Ecological Conscience." Environmental Ethics 28(2006):315-322. Our concern for nonhuman nature can be justified in terms of a human right to liberty of ecological conscience. This right is analogous to the right to religious liberty, and is equally worthy of recognition as that fundamental liberty. The liberty of ecological conscience, like religious liberty, is a negative right against interference. Each ecological conscience supports a claim to protection of the parts of nonhuman nature that are current or potential sites of its active pursuit of natural value. If we acknowledge the fallibility of each conscience in its pursuit of genuine natural value, a policy of indefinitely extensive conservation can be justified. Destruction of an object of current or potential natural value is like destroying a church, mosque, temple, or other holy place. This justification for environmental

conservation is analogous to the standard justification for individual negative rights, as upheld by the liberal tradition of Locke, Mill, and Rawls. (EE)

Lercher, Aaron. "Is Anyone to Blame for Pollution?" Environmental Ethics 26(2004):403-410. By making use of a distinction between "making something happen" and "allowing it to happen," a polluting act can be defined as making something happen with widely scattered externalized costs. Not all polluting acts are blameworthy, but we can investigate which polluting acts are sufficiently badly performed as to be blameworthy. This definition of polluting act permits us to justify the belief we often have that behavior concerning pollution may be blameworthy, even when we do not know whether the behavior caused harm. (EE)

Leshy, JD, "Mining Law Reform Redux, Once More," Natural Resources Journal 42(no.3, 2002): 461-490.

Leshy, John D., "Challenges to Environmental Law", Environmental Law, 25(No.4, 1995):967- . Leshy is the Solicitor of the United States Department of the Interior. Pointing to current efforts by Congressional Republicans to weaken many existing environmental laws, Leshy emphasizes the urgent need for continued scholarship and public service in the fields of environmental and natural resources law.

Leshy, John D., "Water and Wilderness/Law and Politics," Land and Water Law Review (University of Wyoming, College of Law) 33 (no. 2, 1988):389-417. Excellent article summarizing what is and what is not at stake in the current controversy over water rights that go with wilderness designation. Although opponents of water rights for wilderness have been noisy, in fact existing water rights holders have little at stake, since wilderness water rights "are for the most part rights to in-stream, non-consumptive use, which means that they actually preserve flows for diversion and consumptive use below the federal reservation." Wilderness water rights are also typically junior, since they date from the wilderness designation. Wilderness advocates have achieved signal victories in convincing the nation that significant tracts of federal land ought to be set aside and preserved in their natural condition "as embodying an ethical expression by our culture about itself and its relationship to our natural heritage." Opponents of wilderness water rights can often successfully delay new wilderness designations, since Congress dislikes tampering with the status quo in water law. On the other hand Congress and the federal courts have regularly insisted that designation of federal lands implies reservation of water adequate for the purposes of the designation. Opponents of wilderness water rights may find their strategies successful in short term only to lose credibility in the long term, given how little is really at stake and the considerable popularity of wilderness. "Wilderness is ... the driving engine in federal land management policy just about every

place roadless areas exist." Lesly is professor of law, Arizona State University. (v1,#4)

Leslie, John, "The End is More Nigh," Times Higher Education Supplement, February 16, 1966, page 15. "If you view the certainty of global warming, the likelihood of nuclear war and the possibility of grey goo calamity from the perspective of the doomsday argument, nobody should bet on humanity's long-term survival." "I believe that humans may have little more than a half chance of surviving the next 500 years. Inclined at first to say that the risk of Doom within five centuries was only about 5 per cent, I found myself changing this to 40 percent. I reached this conclusion after considering the various dangers facing us in the light of what has come to be known as the 'doomsday argument,' which has made me much less optimistic about the future of humankind."

Leslie, John, The End of the World: the Science and Ethics of Human Extinction. London and New York: Routledge, 1996. ISBN 0-415-14043-9. 310 pages. Hardback, 310 pages; \$23 US, \$29.95 Can, £16.99. Of all humans so far, roughly 10% are alive with you and me. If human extinction occurred soon, our position in population history would have been fairly ordinary. But if humankind survived at least a few more centuries, perhaps colonizing the galaxy, we could be among the earliest 0.001% of all humans--a point crucial to a "doomsday argument" originated by the cosmologist Brandon Carter. People who accept the argument will re-estimate the threats to humankind. These include asteroid impacts; nuclear, chemical and biological warfare; ozone layer destruction; greenhouse warming, possibly of a runaway kind; overpopulation; poisoning of the environment; new diseases; computers replacing humans entirely; disasters from genetic engineering or from nanotechnology; and perhaps even destruction of the galaxy through a "vacuum metastability upset" initiated by physicists. As well as discussing all this, The End of the World asks why it should worry us. Is anything ever better than anything else, as a genuine fact? Are lives almost never worth living, or do only miserable ones really matter? Could nuclear revenge be appropriate although it did no good? And when people of future generations are mere possibilities, what right have they to be born? Leslie is a well known philosopher and cosmologist at the University of Guelph. (v7,#1)

Letcher Andy, "Lifestyle: 'If You Go Down to the Woods Today...': Spirituality and the Eco-Protest Lifestyle," Ecotheology Vol 7 (No. 1, July 2002):88-90. Emerging from the anti-road protests which marked the 1990s, Eco-Paganism is a collective term for the diverse set of de-traditionalised, but Pagan-like, spiritualities found within road-protest culture. Whilst the actions, and direct-action, of protesters may not always appear outwardly to be religious, many protesters are motivated by their religious convictions such as the paramount belief in the sanctity of nature. The protest lifestyle, involving an immersion in nature through living outdoors and sleeping in treehouses, reinforces these convictions. These sentiments, and the anguish felt by practitioners as they engage in environmental struggle, find expression through spontaneous rituals. This article provides an over-view of the protest lifestyle, suggesting ways in which it informs Eco-Pagan religiosity. An example of a typical ad-hoc religious ritual is provided.

Levin, SA, "Self Organization and the Emergence of Complexity in Ecological Systems," BioScience 55 (no. 12, December 2005): 1075-1079. What explains the remarkable regularities in distribution and abundance of species, size distributions of organisms, or patterns of nutrient use? How does the biosphere maintain exactly the right conditions necessary for life as we know it? Gaia theory postulates that the biota regulates conditions at levels it needs for survival, but evolutionary biologists reject this explanation because it lacks a mechanistic basis. Similarly, the notion of self organized criticality fails to recognize the importance of the heterogeneity and modularity of ecological systems. Ecosystems are complex adaptive systems, in which pattern emerges from, and feeds back to affect, the actions of

adaptive individual agents, and in which cooperation and multicellularity can develop and provide the regulation of local environments, and indeed impose regularity at higher levels.

Levin, Simon, editor-in-chief, Encyclopedia of Biodiversity. San Diego: Academic Press, 2001. The Encyclopedia of Biodiversity is a comprehensive study of the topic of diversity in the natural world, contained within the covers of a single unified work. It consists of five volumes and includes 313 separate full-length articles by leading international authors, from "Acid Rain and Deposition" through "Zoos and Zoological Parks." Many articles focus on particular taxonomic groups: "Arachnids," "Fungi," "Hymenoptera," "Salmon." Others focus on important biological concepts or areas of study: "Dispersal Biogeography," "The Concept of the Ecosystem," "Mass Extinctions," "Methods of Taxonomy." Still others focus on management issues: "Ex Situ, In Situ Conservation," "Insecticide Resistance," "Logged Forests," "Soil Conservation." In his foreword, E.O. Wilson writes: "The articles in the Encyclopedia of Biodiversity are unusually eclectic, yet organized by a set of easily articulated goals. They are the following: to carry the systematics and biogeography of the world fauna and flora toward completion; map the hotspots where conservation will save the most biodiversity; orient studies of natural history to understand and save threatened species; advance ecosystem studies and biogeography to create the needed principles of community assembly and maintenance; acquire the knowledge of resource use, economics, and polity to advance conservation programs based on sustainability; and enrich the ethic of global conservation in terms persuasive to all."

Many articles should be of interest to environmental ethicists, including the following: (see separate bibliographic listings for each.)

Levin, Simon A., "Complex Adaptive Systems: Exploring the Known, the Unknown and the Unknowable," Bulletin of the American Mathematical Society 40 (no. 1, 2003): 3-19. Complex adaptive systems, such as evolutionary ecosystems, and also human societies, including markets, can sometimes be described with statistical mathematics in the trends, though the detail is unpredictable. In biology, a major problem is the widespread scales, from the molecular to global. Biologists know most about selection operating on individuals, but complex systems transcend individuals. Even with individuals, biologists do not know what mutations will take place. Levin is in ecology and evolution at Princeton University.

Levine, Michael P., "Pantheism, Ethics, and Ecology." Environmental Values 3(1994):121-138. Pantheism is a metaphysical and religious position. Broadly defined it is the view that (1) "God is everything and everything is God...the world is either identical with God or in some way a self-expression of his nature" (H.P. Owen). Similarly, it is the view that (2) everything that exists constitutes a 'unity' and this all-inclusive unity is in some sense divine (A. MacIntyre). I begin with an account of what the pantheist's ethical position is formally likely to be. I then discuss the relationship between pantheism and ecology in the context of the search for the metaphysical and ethical foundations for an ecological ethic. It is claimed that it is no accident that pantheism is often looked to for such foundations. KEYWORDS: ecology, environment, ethics, pantheism, Spinoza. Levine is in philosophy at the University of Western Australia. (EV)

Levit, George S., Wolfgang E. Krumbein, and Reiner Grübel. "Space and Time in the Works of V. I. Vernadsky." Environmental Ethics 22(2000):377-396. The main objective of this paper is to introduce the space-time concept of V. I. Vernadsky and to show the importance of this concept for understanding the biosphere theory of Vernadsky. A central issue is the principle of dissymmetry, which was proposed by Louis Pasteur and further developed by Pierre Curie and Vernadsky. The dissymmetry principle, applied both to the spatial and temporal properties of living matter, makes it possible to demonstrate the unified

nature of space and time. At the same time, this principle shows the difference between the spatial-temporal properties of living matter and those of the inert environment. Living matter as opposed to the inert environment is an important part of the Weltanschauung of Vernadsky and is connected with all basic statements of his theoretical system. (EE)

Levitus, S., et al, "Warming of the World Ocean," Science 287(2000):2225-2229; Kerr, Richard A., "Globe's 'Missing Warning' Found in the Ocean," Science 287(2000):2126-2127. Earth's Missing Warming Found in the Ocean. Greenhouse skeptics have claimed that there is not as much global warming as most models predict, and modelers have long held that this warming is in the oceans, but not had adequate data on ocean warming. A recent study integrates previously scattered data on ocean temperature profiles, and finds the missing warming. Half the warming occurs above 300 meters, but half is below. This also leads to predictions that global warming, though perhaps taking place more slowly than predicted, will be in the high ranges of prediction. (v.11,#1)

Levy, Sanford S. "The Biophilia Hypothesis and Anthropocentric Environmentalism." Environmental Ethics 25(2003):227-246. Much anthropocentric environmental argument is limited by a narrow conception of how humans can benefit from nature. E. O. Wilson defends a more robust anthropocentric environmentalism based on a broader understanding of these benefits. At the center of his argument is the biophilia hypothesis according to which humans have an evolutionarily crafted, aesthetic and spiritual affinity for nature. However, the "biophilia hypothesis" covers a variety of claims, some modest and some more extreme. Insofar as we have significant evidence for biophilia, it favors modest versions which do not support a particularly robust anthropocentric environmental ethic. A significantly more robust environmental ethic requires the most extreme version of the biophilia hypothesis, for which there is the least evidence. (EE)

Lewis, Martin W., Green Delusions: An Environmentalist Critique of Radical Environmentalism. Durham, NC: Duke University Press, 1992. 288 pages, cloth. "Eco-radicalism tells us that we must dismantle our technological and economic system, and ultimately our entire civilization. Once we do so, the rifts between humanity and nature will purportedly heal automatically. I disagree. What I believe we must do is disengage humanity from nature by cleaving to, but carefully guiding, the path of technological progress. It is for the environmental community to decide which alternative offers the best hope for ecological salvation" (p. 251, concluding paragraph). Many of the most devoted and strident "greens," those who propose a radical environmentalism, unwittingly espouse an ill-conceived doctrine that has devastating implications for the global ecosystem. Lewis distinguishes the main variants of eco-extremism, exposes the fallacies upon which such views ultimately flounder, and demonstrates that the policies advocated by their proponents would, if enacted, result in unequivocal ecological catastrophe. The agenda proposed by eco-extremists, based on local economic self-sufficiency, a shunning of market exchange, and a general retreat from advanced technology would require a thoroughgoing reinvention of all social and economic forms. That has the potential for monumental disruption and complete political alienation, an undermining of the very foundations on which a new and ecologically sane economic order must be built. Lewis advocates moving forward into the solar age, an age that will require more investment in our technological infrastructure and well as the retention of a globally integrated economy. Lewis, once himself a radical environmentalist (p. 80), now advocates what he calls a "Promethean environmentalism" (p. 16, p. 250, etc.). In order to advance the reforms needed to change our present course, environmentalism must avoid divisive radical philosophies and try to create a broad-ranging consensus. Lewis is Assistant Professor of Geography at George Washington University. (v3,#3)

Lewis, Michael, ed. *American Wilderness: A New History*. Oxford: Oxford University Press, 2007. In this anthology, fourteen historians provide a nuanced look at how and where wilderness has been protected and preserved by Americans in the past and today. Beginning with indigenous peoples and the first contact between Europeans and the New World and ending with the debates over the Alaskan wilderness at the end of the twentieth century, this anthology focuses on events, people, and themes in the history of the United States and its wild landscapes.

Librova, Hana. "The Disparate Roots of Voluntary Modesty." Environmental Values 8(1999):369-380. ABSTRACT: The effective solution of environmental problems calls for changes in levels of consumption. Sociologists have described moderation in households of high socio-economic status in affluent countries, and also a type of modesty which cannot be a response to the experience of abundance.

However, its essence is not the way of life of a traditional community. Sustainable living based on self-restraint could be considered to be a symptom of the summit of cultural evolution to date. Nevertheless, historical experience warns us against making too much of contemporary cases of moderation. KEYWORDS: voluntary modesty, international sociological comparison. Lienhoop, Nele and Douglas C. MacMillan, "Contingent Valuation: Comparing Participant Performance in Group-Based Approaches and Personal Interviews," *Environmental Values* 16(2007): 209-232. This paper reports a Contingent Valuation application to estimate the non-market costs and benefits of hydro scheme developments in an Icelandic wilderness area. A deliberative group-based approach, called Market Stall, is compared to a control group consisting of conventional in-person interviews, in order to investigate flaws of Contingent Valuation, such as poor validity and protest responses. Perceived property rights suggested the use of willingness-to-accept in compensation for wilderness loss and willingness-to-pay for hydro scheme benefits. The study is novel as it applies participant behaviour observation to gain insights into the shortcomings of conventional data collection modes. Main drawbacks with in-person interviews were found to be low motivation, standardised information and time pressure which hindered individuals from carefully considering their preferences. Market Stall performed better in the study: welfare estimates were more easily explained by socio-economic variables, the non-response rate was lower, and respondents were more engaged. Our research findings also suggest that participant behaviour can be used to supplement conventional validity tests. Lienhoop is at the Helmholtz Centre for Environmental Research, Leipzig, Germany. MacMillan is in anthropology, University of Kent, Canterbury, UK.

- Light, Andrew, and Katz, Eric, eds. Environmental Pragmatism. New York: Routledge, 1996. 352 pp. Notes. Index. \$65.00 cloth; \$19.95 paper. By applying classical American pragmatist thought to the environment, this anthology defines and develops the pragmatic approach (methodology or strategy). The approach is more a method of inquiry and problem-solving than a position (or theory). Generally, the search for a single comprehensive theory is rejected in favor of conceptual pluralism, on the grounds that commitment to a theory can (and often) hinders problem-solving and policy formulation, adoption, and implementation. The volume is likely to become the classic statement of the pragmatist environmental approach. Contributors include such important pragmatists as Bryan Norton, Anthony Weston, and Larry Hickman (the Director of the Dewey Center at Southern Illinois University). Light is in the Department of Philosophy at the University of Montana. Katz is in Philosophy at New Jersey Institute of Technology.

Light, Andrew, Higgs, Eric S., "The Politics of Ecological Restoration," Environmental Ethics 18(1996):227-247.

Discussion of ecological restoration in environmental ethics has tended to center on issues about the nature and character of the values that may or may not be produced by restored landscapes. In this paper we shift the philosophical discussion to another set of issues: the social and political context in which

restorations are performed. We offer first an evaluation of the political issues in the practice of restoration in general and second an assessment of the political context into which restoration is being put. By means of a comparative examination of these two areas of inquiry, we provide a foundation for a critical assessment of the politics

Light, Andrew, "What is an Ecological Identity?," Environmental Politics 9 (No. 4, 2000): 59-81. Is environmentalism a form of identity politics like feminism, race based politics, and other political orientations at the core of the new social movements? This paper argues that it can be, but that this claim to political identity has only been clearly available so far to a narrow set of environmentalists, most notably deep ecologists and essentialist ecofeminists. But if it is plausible that broader forms of environmentalism can represent a political identity, then a set of political objections to the content of environmentalism become much more salient than they might at first appear. After attempting a thorough assessment of the possible interpretations of an environmental identity politics, I look at the political problems that follow. If environmentalists decide to articulate their environmentalism as a kind of 'ecological identity', and it is surely an open question as to whether they should, then this identity will encounter some serious hurdles that deserve attention. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#1)

Light, Andrew and Alan Rudy, "Social Ecology and Social Labor: A Consideration and Critique of Murray Bookchin," Capitalism, Nature, Socialism, June 1995, pp 75-106. The first comprehensive critique of social ecology from an ecological socialist perspective. The first part of the paper summarizes the basic social and political ground of Bookchin's theories; the second part argues that the absence of the category of social labor ultimately undermines the transformative potential of social ecology. (v7,#1)

3, September 1998):20-24. Introduction to a symposium on Steven Vogel's Against Nature: The Concept of Nature in Critical Theory (SUNY Press, 1998). Includes contributions by Lorenzo Simpson, Alan Rudy, David Maccauley and Vogel. (v.10,#3)

Light, Andrew, and Eric Katz, eds., Environmental Pragmatism. London and New York: Routledge Press, 1996. 352 pages. Contents: "Introduction: Environmental Pragmatism and Environmental Ethics as Contested Terrain," Andrew Light and Eric Katz; "Pragmatism and Environmental Thought," Kelly A. Parker; "How Pragmatism is an Environmental Ethic," Sandra B. Rosenthal and Rogene A. Buchholz; "Nature as Culture: John Dewey's Pragmatic Naturalism," Larry A. Hickman; "The Environmental Value in G. H. Mead's Cosmology," Ari Santos; "The Constancy of Leopold's Land Ethic," Bryan Norton; "Integration or Reduction: Two Approaches to Environmental Values," Bryan Norton; "Before Environmental Ethics," Anthony Weston; "Compatibilism in Political Ecology," Andrew Light; "Pragmatism and Policy: The Case of Water," Paul B. Thompson; "Towards a Pragmatic Approach to Definition: Wetlands and the Politics of Meaning," Edward Schiappa; "A Pluralistic, Pragmatic and Evolutionary Approach to Natural Resource Management," Emery N. Castle; "Laws of Nature vs. Laws of Respect: Non-Violence in Practice in Norway," David Rothenberg; "Teaching Environmental Ethics as a Method of Conflict Management," Gary E. Varner, Susan J. Gilbertz, and Tarla Rai Peterson; "Beyond Intrinsic Value: Pragmatism in Environmental Ethics," Anthony Weston; "Searching for Intrinsic Value: Pragmatism and Despair in Environmental Ethics," Eric Katz; "Unfair to Swamps: A Reply to Katz--Unfair to Foundations?: A Reply to Weston," Anthony Weston and Eric Katz; "Environmental Pragmatism as Philosophy or Metaphilosophy?: On the Weston-Katz Debate," Andrew Light.

The first comprehensive presentation of environmental pragmatism as a new approach. Environmental pragmatism argues that theoretical debates are hindering the ability of the environmental movement to forge agreement on basic policy imperatives. This new direction advocates a serious (though not theoretical) inquiry into the practical merits of moral pluralism, using the methodology of classical American pragmatist thought. (v7,#1)

Light, Andrew, "Urban Wilderness," Wild Ideas, ed. David Rothenberg (Minneapolis: University of Minnesota Press, 1995), pp. 195-211. Short version reprinted as "Whither Classical Wilderness?," in The Trumpeter, March 1995. Distinguishes between two historical conceptions of the idea of wilderness--classical and romantic--and argues that the idea of the classical wilderness has been transferred to descriptions of urban spaces. Discusses the notions of wilderness of the Puritans, Upton Sinclair, and Mike Davis (writing about Los Angeles). (v7,#1)

Light, Andrew, "Boys in the Woods: Urban Wilderness in American Cinema," in The Nature of Cities: Ecocriticism and Urban Environments, ed. Michael Bennett and David Teague (Tucson: University of Arizona Press, 1999). This paper furthers the author's earlier arguments concerning the use of the metaphor of wilderness to describe inner cities (see Light's "Urban Wilderness," in Wild Ideas, ed. David Rothenberg, University of Minnesota Press, 1995) by tracking the malicious representation of the city as an urban wilderness in recent American cinema. The article closes with a look at the more hopeful appeals to an urban wilderness in portrayals of the inner city by African-American film makers like John Singleton and the Hughes brothers. The point of this analysis is to serve a normative critique of the description of racial minorities as the inhabitants of an urban wilderness; a continuation of the legacy of the depiction of racial others and nature itself as uncivilized and thus unworthy of equal moral consideration. Light, Andrew and Ben Shippen, Jr., "Is Environmental Quality a Public Good?" Working Paper, Eco-Research Chair, Environmental Risk Management, University of Alberta, Edmonton, Alberta, Canada. Environmental protection, like police protection, is something which we want to be provided equally as a public good. The legal standards should not be lower in one place than another. But solutions to environmental pollution based on economic incentives that trade pollution rights do not have equal results and allow different regions of the country to be treated unequally. This is like allowing, as a matter of policy, more crimes in one part of a city as long as few are committed in another part. Light is in philosophy at the University of Alberta, Shippen in economics at Florida State University. (v6,#4)

Light, Andrew, "Environmental Pragmatism and Valuation in Nature," Human Ecology: Crossing Boundaries, ed. Scott D. Wright et al, (Fort Collins, CO: Society for Human Ecology, 1993), pp. 23-30. The first published version of the author's work on environmental pragmatism. Includes a discussion of environmental pedagogy (especially the work of David Orr) as a form of environmental pragmatism. (v7,#1)

Light, Andrew, "Three Questions on Hyperreality," Research in Philosophy and Technology, vol 15, 1995. A response to Albert Borgmann's "The Nature of Reality and the Reality of Nature," in Soulé and Lease, eds., Reinventing Nature? (Island Press, 1995). Argues that Borgmann's position on the social construction of nature leads to several puzzles which follow from his attempt to integrate postmodernism and environmental philosophy. (v7,#1)

Light, Andrew, "Contemporary Environmental Ethics: From Metaethics to Public Philosophy," Metaphilosophy 33 (No. 3, 2002). In the past 30 years environmental ethics has emerged as one of the most vibrant and exciting areas of applied philosophy. Several journals and hundreds of books testify to its growing importance inside and outside philosophical circles. But with all of this scholarly output, it is

arguably the case that environmental ethics is not living up to its promise of providing a philosophical contribution to the resolution of environmental problems. Shippen Jr. was an assistant professor of economics at Mercer University, Macon, Georgia before becoming a research economist at ERS Group.

Light, Andrew, "Restoring Ecological Citizenship," in Democracy and the Claims of Nature, ed. B. Minter and B. P. Taylor (Lanham, MD: Rowman & Littlefield, 2002). Argues that if we take seriously the value of public participation in restoration then we need to understand participation as democratic participation. Claims that this notion of democratic participation is best understood as a form of environmental citizenship (along a republican model of citizenship). Argues against an identity model of participation and uses the debate in restoration over prairie burning to illustrate the difference between the citizenship and identity models. Concludes with a brief account of how these claims could be put into a legal and policy framework. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu.

Light, Andrew and de-Shalit, Avner, eds., Moral and Political Reasoning in Environmental Practice. Cambridge, MA: The MIT Press, 2002. 12 new papers relating the problem of environmental ethics and political philosophy to environmental practice. Divided into a general theoretical section on the problem of overcoming theory and practice divide, a section discussing new philosophical tools for improving practices and policies and a third section of case studies. Papers originated at the combined ISEE/Society for Applied Philosophy Meeting at Oxford University in July 1999.

Introduction offers a critique of Callicott's claims about environmental philosophy itself being the most radical version of environmental activism. Contents:

Light, Andrew, "The Role of Technology in Environmental Questions: Martin Buber and Deep Ecology as Answers to Technological Consciousness," Research in Philosophy and Technology, Vol. 12, 1992, pp. 83-104. When viewed as responses to the imposition of forms of technological domination over nature, the views of the deep ecologists (especially Naess) are remarkably similar to the onto-theology of Martin Buber. Suggests that ultimately Buber's approach to topic is even more radical than Naess's. (v7,#1)

Light, Andrew, "Technology, Democracy, and Environmentalism: On Feenberg's Questioning Technology," Ends and Means: Journal of Philosophy, Technology and Society, 4 (No. 2, 2000): 7-17. Offers a critique of the environmental implications of Andrew Feenberg's work in Questioning Technology (Routledge, 1999). Light rejects Feenberg's claim of the importance of the Ehrlich-Commoner debate in the development of environmental thought and questions the role of the relationship between democratically controlled technology and democratic environmental practices. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#2)

Light, Andrew, "Restauración Ecológica y Reproducción del Arte," in Ingeniería Genética Y Ambiental: Problemas filosóficos y sociales de la biotecnología, ed. T. Kwiatkowska and R. L. Wilchis (Mexico City: Plaza y Valdez, 2000), pp. 209-219. ("Ecological Restoration and Art Reproduction") Robert Elliot's "Faking Nature," represents one of the strongest philosophical rejections of the ground of restoration ecology ever offered. Here, and in a succession of papers defending the original essay, Elliot argued that ecological restoration was akin to art forgery. Just as a copied art work could not reproduce the value of the original, restored nature could not reproduce the value of nature. I reject Elliot's art forgery analogy, and argue that his paper provides grounds for distinguishing between two forms of restoration that must be given separate normative consideration: (1) malicious restorations, those undertaken as a means of justifying harm to nature, and (2) benevolent restorations, or, those which are akin to art restorations and which cannot serve as justifications for the conditions which would warrant their engagement. This argument will require an investigation of Mark Sagoff's arguments concerning the normative status of art restorations. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#1)

Light, Andrew, "Materialists, Ontologists, and Environmental Pragmatists," Social Theory and Practice 21 (No. 2, Summer 1995): 315-333. Expanded version reprinted as "Compatibilism in Political Ecology," in Environmental Pragmatism, ed. A. Light and E. Katz, (London: Routledge, 1996), pp. 161-184. A strategy for resolving competing claims within environmental political theory, focusing on debates between two kinds of theorists: ontologists--such as deep ecologists--and materialists--such as Murray Bookchin and the social ecologists. The urgency of the ecological crisis requires a form of metatheoretical compatibilism between the opposing theories. The argument is derived from a selective and critical reading of Rorty's neo-pragmatism concerning the distinction between public and private practice. (v7,#1)

Light, Andrew, "Hegemony and Democracy: How the Inherent Politics in Restoration Informs the Politics of Restoration," Restoration and Management Notes 12 (No. 2, Winter 1995):140-144. Argues that ecological restoration contains an inherent political dimension which consists in the potential it always has to serve as the ground for public participation in the human-nature community. (v7,#1)

Light, Andrew, "Reconsidering Bookchin and Marcuse as Environmental Materialists: Toward an Evolving Social Ecology," in Social Ecology after Bookchin, ed. A. Light (New York: Guilford, 1998), pp. 343-383. Entirely reworks and supercedes Light's early paper on Bookchin and Marcuse published in 1993 in Capitalism, Nature, Socialism. Argues that if Bookchin and Marcuse can be read as environmental materialists then Marcuse's work may shed light on how social ecology can be reconciled

with deep ecology. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu.

Light, Andrew, "Contemporary Environmental Ethics: From Metaethics to Public Philosophy," Metaphilosophy, 33 (No. 4, July 2002), pp. 426-449. In the past 30 years environmental ethics has emerged as one of the most vibrant and exciting areas of applied philosophy. Several journals and hundreds of books testify to its growing importance inside and outside philosophical circles. But with all of this scholarly output, it is arguably the case that environmental ethics is not living up to its promise of providing a philosophical contribution to the resolution of environmental problems. This article surveys the current state of the field and offers an alternative path for its future development toward a more publicly engaged model of applied philosophy. The article includes a substantial section criticizing previous attempts to link environmental ethics and environmental policy, especially the work by nonanthropocentrists on the problem of preservation of the Brazilian rainforest. (v.13, #3)

Light, Andrew, "Rereading Bookchin and Marcuse as Environmental Materialists," Capitalism, Nature, Socialism, 4 (No. 1, March 1993): 69-98. Translated and republished as "Il Materialismo Ambientale Bookchin e Marcuse a Confronto," Capitalismo, Natura, Socialismo, issue 10, February 1994, pp. 110-139. Argues that Bookchin's critique of the Frankfurt School in general and Herbert Marcuse in particular is flawed, since an examination of both Bookchin and Marcuse reveals that they are both "environmental materialists."

Light, Andrew, ed., Ecosystem Health (Blackwell Science), vol. 4, no. 3, September 1998, theme issue: "Environmental Ethics and Environmental Risk Management." Includes:

--Light, Andrew, "Environmental Ethics and Environmental Risk: Expanding the Scope of Ecosystem Health" An argument for why environmental pragmatism can be used as a bridge between environmental ethics and environmental risk management. Includes a critique of the debate on the merits of pragmatism in this journal between Kristin Shrader-Frechette, Baird Callicott, and Bryan Norton.

--Hood, Robert, "The Very Idea of Ecosystem Health"

--Tal, Alon, "Beyond the Rhetoric of Premeditated Murder: Towards A Rational and Compassionate Environmentalist Perspective About The Ethics of Risk Assessment"

--Boetzkes, Elisabeth, "Gender, Risk, and Scientific Proceduralism."

Light, Andrew, Nature, Class, and the Built World: Philosophical Essays between Political Ecology and Critical Technology, 1996, University of California, Riverside, Ph.D. thesis in philosophy. 295 pages. Philosophical disagreements on environmental questions can sometimes be set aside in order to achieve compatible strategies to work toward improving environmental conditions. As part of this strategy, pragmatists call for abandoning the existing prejudices of environmental philosophy, in particular nonanthropocentrism and commitments to moral monism. The social ecology-deep ecology divide in political ecology, and the debate between monists and pluralists in environmental ethics. Both debates are used to advance the pragmatist position. The privatization of environmental regulations, and restoration ecology. Questions concerning urban space and political identity. Technology and built space have traditionally been ignored by environmental philosophers. Space and place are integral to an environmental philosophy tempered by pragmatic concerns. The advisor was Bernd Magnus. (v.10,#1)

Light, Andrew, "Taking Environmental Ethics Public," in Environmental Ethics: What Really Matters? What Really Works?, ed. D. Schmidtz and E. Willott (Oxford: Oxford University Press, 2001), pp. 556-566. The pragmatist critique of environmental ethics has argued that the field has largely failed in offering a set of moral foundations to improving environmental policies or for motivating agents to embrace more supportive environmental practices. If this critique is taken seriously then a reassessment

is needed of how to encompasses both a traditional philosophical task involving an investigation into the value of nature, and a second public task involving the articulation of arguments which will be morally motivating concerning environmental protection. This chapter overviews the case for a demarcation of these tasks and makes a claim about their relative importance in relation to each other in the context of a methodological form of environmental pragmatism (as opposed to a more purely philosophical application of the work of particular pragmatists to environmental questions). The result is a form of environmental pragmatism that a nonpragmatist could embrace in environmental ethics. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#1)

Light, Andrew, "Environmental Ethics and Environmental Risk: Expanding the Scope of Ecosystem Health," Ecosystem Health, Vol. 4, No. 3, September 1998, pp. 147-151 (double pages). Introduction to a symposium on environmental ethics and environmental risk assessment. Argues that the ethical implications of risk management are to be best understood within the context of ecosystem health. Especially important in order to cease thinking about environmental risk assessment and management solely in terms of human health issues and instead broaden its scope to cover human health in relation to the environment. Includes a discussion of an exchange in the same journal between Bryan Norton, Baird Callicott and Kristin Shrader-Frechette on the role of pragmatism in understanding ecosystem health. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu.

Light, Andrew, "Borgmann's Unzeitgemässe Betrachtungen: On the Pre-Political Conditions of Politics of Place," in Technology and the Good Life?, ed., E. Higgs, A. Light, and D. Strong (Chicago: University of Chicago Press, 2000), pp. 106-125. Offers a defense against the claim that Albert Borgmann's work in philosophy of technology is politically conservative. Argues that Borgmann's work is culturally conservative and does not contain an explicit or formal political philosophy. Instead, Borgmann's work is best understood politically as offering pre-political conditions for how we should understand the normative value of places. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#2)

Light, Andrew, "'Place Authenticity as Ontology or Psychological State?" Philosophy and Geography, 5 (No. 2, 2002), pp. 204-210. This article responds to Eric Katz's "The Authenticity of Place in Culture and Nature: Thoughts on the Holocaust in the Spanish Synagogue of Venice," in the same issue of the journal. Light argues that Katz's attempt to extend his work on authenticity in ecological restoration to the cultural experience of place confuses a psychological with a metaphysical account of authenticity. The piece concludes with an appeal for an aesthetic understanding of the importance of place in environmental philosophy. (v.13, #3)

Light, Andrew, "On the Irreplaceability of Place," Worldviews: Environment, Culture, Religion 2(1998):179-184. Analysis of a puzzle concerning Christoph Rehmann-Sutter and the irreplaceability of place. If places are designated as valuable in part because they are irreplaceable, and if any human can appreciate any place, then how can humans ever be part of a place if they are ultimately substitutable as agents who appreciate places? Two possible answers: Two kinds of bioregionalism, liberal bioregionalism and communitarian bioregionalism are identified. Liberal bioregionalism, recommended for the present, avoids the irreplaceability problem by jettisoning the need to focus on the special qualities of a particular place. Communitarian bioregionalism might be a goal down the road. Light is in philosophy and environmental studies, Binghamton University, SUNY. (v.10,#2)

Light, Andrew, "Moral Progress Amid Technological Change," Journal of Speculative Philosophy 15 (No. 3, 2001): 195-201. Response to John Lachs's "Both Better Off and Better," in same issue which argues that increasing affluence has led to moral progress. Light claims that Lachs errs in not considering the combined environmental consequences and consequences to future generations of increases in individual welfare. Examples discussed include trade-

offs between advantages of owning cars and contributions to greenhouse gases and sustainable agriculture. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#1)

Light, Andrew, "Restoration, the Value of Participation, and the Risks of Professionalization," in Restoring Nature: Perspectives from the Social Sciences and Humanities, ed. P. Gobster and B. Hull (Washington, D.C.: Island Press, 2000), pp. 163-181. Efforts to professionalize restoration include the regulation of restoration projects, the certification of restoration volunteers, and the creation and accreditation of restoration degree programs. By increasing the expertise and authority of restorationists, professionalization offers a potential mechanism to reduce the conflict that seems inherent in many restoration projects. However, professionalization may have significant costs. Professionalism will likely close the content of the language of restoration by controlling how concepts, terms, and practices of restoration are defined and delimited. This control may make restoration less participatory and degrade the unique democratic potential of restoration projects. I address these issues using as an example the conflict created by the numerous restorations known collectively as the Chicago Wilderness project. The first section expands on and supercedes the discussion of the democratic values implicit in acts of restoration discussed in Light's 1996 article with Eric Higgs, "The Politics of Ecological Restoration," in Environmental Ethics. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#2)

Light, Andrew, "Ecological Restoration and the Culture of Nature: A Pragmatic Perspective," in Restoring Nature: Perspectives from the Social Sciences and Humanities, ed. P. Gobster and B. Hull (Washington, D.C.: Island Press, 2000), pp. 49-70. Most environmental philosophers have failed to understand the theoretical and practical importance of ecological restoration. This failure is primarily due to the mistaken impression that ecological restoration is only an attempt to restore nature itself, rather than an effort to restore an important part of the human relationship with non-human nature. I first discuss the possibility of transforming environmental philosophy into a more pragmatic discipline, better suited to contributing to the formation of sound environmental policies, including ecological restoration. In particular, I advocate an alternative philosophical approach to the kind of work on the value of ecological restoration raised by Eric Katz and other philosophers who claim that restored nature can never reproduce the actual value of nature. Here, I will make this contrast more explicit and go on to further argue that Katz's views in particular are not sufficiently sensitive to the values at work in the variety of projects falling within the category of ecological restoration. A richer description of the ethical implications of restoration will identify a large part of its value in the revitalization of the human culture of nature. Short versions reprinted as "Restoration or Domination?: A Reply to Katz," in Environmental Restoration: Ethics, Theory, and Practice, ed. William Throop (Amherst, NY: Humanity Books (Prometheus), 2000), pp. 95-111, and in Environmental Ethics: What Really Matters? What Really Works?, eds. D. Schmidt and E. Willott (Oxford: Oxford University Press, 2001), pp. 178-187. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#2)

Light, Andrew, "The Urban Blind Spot in Environmental Ethics," Environmental Politics 10 (No. 1, 2001): 7-35. In the past 30 years environmental ethics and political ecology have emerged as two of the most vibrant and exciting areas of applied philosophy. Several journals and hundreds of books testify to their growing importance inside and outside philosophical circles. But surprisingly very little has ever been said, in particular, by environmental ethicists about cities, and what has been written is largely negative. This paper offers an explanation for why the urban environment has been ignored in environmental ethics (with a focus on examples found in Holmes Rolston's work), second, provides a series of ecological and social arguments for why urban issues cannot be overlooked in a complete environmental ethic, and finally, offers an example of the sorts of issues that an expanded environmental ethic, inclusive of urban environments, would need to focus on. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#1)

Light, Andrew, "Public Goods, Future Generations, and Environmental Quality," in Not for Sale: In Defense of Public Goods, ed. A. Anton, M. Fisk, and N. Holmstrom (San Francisco: Westview Press, 2000), pp. 209-226. Environmental quality ought to be preserved as an inviolate publicly provided good. After analyzing the relationship between publicly provided goods (such as fire or police protection) and "pure public goods," I argue that the requirements for the delivery of publicly provided goods are parasitic on the definition of pure public goods, creating a normative burden on those who would advocate the privatization of their delivery or maintenance. Using this claim it is argued that a publicly provided good cannot be privatized if it would result in inequality in the distribution of the good, or diminish the quality of the good. Identification of this argumentative burden on privation efforts is strengthened by a claim that publicly provided goods represent a community's articulation of a suggestion that such goods fulfill commonly held needs. I argue that environmental quality is just such a good. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. (v.13,#2)

Light, Andrew and Roberts, David, "Toward New Foundations in Philosophy of Technology: Mitcham and Wittgenstein on Descriptions," Research in Philosophy and Technology 19 (2000): 125-147. Over the last twenty-five years, philosophy of technology has become a recognizable sub-discipline in the Americas and Europe. There are journals, societies, and international meetings devoted to the subject. But the field suffers from the lack of a common ground on which to base questions that might define it as a philosophical discipline, central questions whose resolution will drive the discipline forward. Certainly there are many views now on the social effects of technology and how we are to evaluate those effects, but the field nonetheless lacks a critical intradisciplinary discussion of those competing views of the kind that characterizes most philosophical sub-fields such as environmental ethics. After reviewing the general state of the field, we turn to an analysis of the work of Carl Mitcham, one philosopher of technology who has focused on a more descriptive approach to identifying the subject of his philosophical endeavors. We then sketch an alternative descriptive approach to Mitcham's grounded in Wittgenstein's descriptive strategies, in part to articulate our own account of improving the descriptive base of the field and in part to show how one form of descriptivism (ours) can critically interact with another (Mitcham's). Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu. Roberts completed an M.A. in philosophy at the University of Montana. (v.13,#1)

Light, Andrew, "Bookchin as/and Social Ecology," in Social Ecology after Bookchin, ed. A. Light (New York: Guilford, 1998), pp. 1-23. A personal account of what went wrong with the development of social ecology and with the social ecology-deep ecology debate. Argues that the later debate, in particular, was largely pointless. Light is in the Applied Philosophy Group at New York University, andrew.light@nyu.edu.

Light, Andrew, and de-Shalit, Avner, eds., Moral and Political Reasoning in Environmental Practice. Cambridge, MA: The MIT Press, 2003. Reviewed by Markku Oksanen in Environmental Values 14(2005):271-274.

Light, Andrew, and Aurora Wallace, "Not Out of the Woods: Preserving the Human in Environmental Architecture," Environmental Values 14(2005):3-20. The North American environmental movement has historically sought to redress the depletion and degradation of natural resources that has been the legacy of the industrial revolution. Predominant in this approach has been the preservation of wilderness, conservation of species biodiversity and the restoration of natural ecosystems. While the results of such activity have often been commendable, several scholars have pointed out that the environmental movement has inherited an unfortunate bias against urban environments, and consequently, a blind spot to ways in which densely populated built spaces can serve to enhance rather than degrade efforts to achieve

sustainability. After exploring this concern we argue that environmental architecture can serve as a counter-balance to this bias, focused, as it is, on the ways in which the construction and organisation of built spaces for humans can help or hinder the pursuit of environmental priorities. But if environmental architecture is to take this role then it must be understood in a broader context, one which does not exclude other moral, political and aesthetic values in the production of human environments. We will highlight several examples of how environmental architecture has combined success and failure at taking a broader view of environmental questions, with a specific focus on one green skyscraper that may be good for the natural environment but not necessarily for the human environment of the city. Light is in the Applied Philosophy Group, New York University, New York, NY. Wallace is in the Department of Culture and Communication, New York University, New York, NY. (EV)

Light, Andrew. "Callicott and Naess on Pluralism." *Inquiry* 39, no. 2 (June 1996): 273-94. The monism-pluralism debate in environmental ethics, first, as it has most recently been advanced by J. Baird Callicott in his "Moral Monism in Environmental Ethics Defended," *Journal of Philosophical Research* 19 (1994). Light assesses Callicott's claim that his communitarianism (combined with a limited intertheoretic pluralism) is sufficient to get the advantages of pluralism advocated by, among others, Stone, Weston, Brennan, Varner, and Hargrove. The author argues that Callicott's claims get us no further in taking up what could be the more important question in the monism-pluralism debate: how do we achieve a compatibilism among ethical theories which will inform better environmental practices? The paper argues, further, that Arne Naess, whose work has heretofore been excluded from the mainstream discussion of this issue, has all along understood the heart of the monism-pluralism question. All involved in the monism-pluralism debate would do well to look at what Naess has to say. (v7, #3)

Linklater, WL, "Wanted for Conservation Research: Behavioral Ecologists with a Broader Perspective", BioScience 54 (no.4, 2004): 352-360(9). Behavioral ecologists have advocated a greater role for behavioral research in conservation, and the contribution of behavioral study to conservation has increased dramatically. However, a review of the literature in the fields of behavioral ecology and conservation finds that half the articles that investigate behavior in conservation journals do not advance beyond the descriptive phase (compared with 14 percent in behavioral ecology journals) and that most articles in behavioral ecology journals (71 percent) are narrowly focused on questions about the adaptive value of behavior, whereas conservation biology journals include more diverse interests such as causative and developmental mechanisms (43 percent). Addressing this mismatch between the disciplines is the key

to improving the utility of behavioral ecology in conservation. The solution I propose is a renewed appreciation of Tinbergen's paradigm, both in behavioral ecology, where it can encourage more pluralistic research by integrating proximate and evolutionary questions, and in conservation biology, where it can structure the advance from descriptive studies of behavior to behavioral problem solving.

Lintott, Sheila. "Toward Eco-Friendly Aesthetics." Environmental Ethics 28(2006):57-76. Environmentalists can make individuals more eco-friendly by dispelling many of the myths and misconceptions about the natural world. By learning what in nature is and is not dangerous, and in what contexts the danger is real, individuals can come to aesthetically appreciate seemingly unappreciable nature. Since aesthetic attraction can be an extremely valuable tool for environmentalists, with potential beyond that of scientific education, the quest for an eco-friendly is neither unnecessary nor redundant. Rather, an eco-friendly aesthetic ought to be pursued in conjunction with other efforts to protect nature. (EE)

Linville, Mark D. "A Little Lower Than the Angels: Christian Humanism and Environmental Ethics," Christian Scholars Review 28(No.2. 1998):283-297. In contrast to Lynn White, Jr., who argues that Christianity is the most anthropocentric of the world's religions and that the West's acceptance of this humanistic approach is responsible for our ecologic crisis, Linville offers an account of human flourishing that includes environmental values and argues that a properly circumspect account of humanism provides an adequate grounding for an environmental ethic. Linzey, Andrew, and Cohn-Sherbok, Dan, After Noah: Animals and the Liberation of Theology. London: Mobray, 1997. Also: New York: Cassell/Continuum. 156 pages. Jewish and Christian traditions have often been blamed for justifying the abuse of animals. While some theologians have been negative about animals, there are ample resources within both traditions to support an enlightened and ethical view of animals. The way we treat animals is a benchmark for the kind of society we are; our attitudes toward animals can liberate theology from an obsessive and idolatrous humanism. (v.9,#4)

Linzey, Andrew, Animal Theology (London: SCM Press, 1994 and Urbana, IL: University of Illinois Press, 1994). "The idea that the specifically animal creation should be the subject of honour and respect because it is created by God, however elementary that idea may now appear to us, is not one that has been given endorsement throughout centuries of Christian thought. Whilst it can be claimed to have some grounding in scripture, in, for example, the psalmist's sense of wonder and beauty of God's creation and in the regard that Jesus claimed even for the sparrows, these intimations have never been developed into systematic theological thought, still less full-blown doctrine." "Are we not to celebrate the life of creation with all its beauty, magnificence and complexity and therein ... to perceive signs of the grandeur of God? Is not the biblical material right to point us to the ways in which some animals at least appear to provide moral examples for our own behaviour? Is not the story of Balaam's ass a sign of how morally advanced are the beasts compared to the mindless Balaams of our world?" "Christians have so little to contribute to the contemporary debate about animals because they have failed to think theologically afresh." Linzey is at Mansfield College, Oxford. List, Charles J., "On the Moral Significance of a Hunting Ethic," Ethics and the Environment 3(1998):157-175. This paper challenges the claim made by critics and some defenders of hunting, that any ethical code hunters chose to follow is irrelevant to the issue of the morality of hunting. My case is made by (1) constructing a hunting code which meets certain prominent objections to their moral significance, (2) conceptually tying this code to an environmental ethic--Leopold's land ethic, and (3) tying the land ethic to a traditional moral theory--Aristotelian virtue ethics. So, the constructed code is morally significant because it is consistent with and made intelligible by a standard moral theory. List is in philosophy, Plattsburgh State University of New York, Plattsburgh, NY. (E&E)

List, Charles J. "Is Hunting a Right Thing?" Environmental Ethics 19(1997):405-416. I argue that sport hunting is a right thing according to Leopold's land ethic. First, I argue that what Leopold means by a "thing" ("A thing is right . . .") is not a human action, as is generally assumed, but rather a practice of conservation that is an activity connecting humans to the land. Such an "outdoor" activity emphasizes internal rewards and the achievement of excellence according to standards which at least partially define the activity. To say that hunting is a right thing is to say that the practice of sport hunting tends in the direction of the land ethic. The actions of individual hunters are judged to be ethical or not by the standards of the practice; these standards are in turn evaluated by the precepts of the land ethic. Second, I discuss how the practical standards are evaluated. I argue that the concepts of integrity, stability, and beauty, contrary to some interpretations, are not inherent values of the biotic community, but rather labels

carefully chosen by Leopold as three conduits for the ecological conscience necessary for the land ethic: the ethical, the ecological, and the aesthetic. I show that Leopold uses this model for his own evaluation of the practice of hunting as well as his evaluation of other practices of conservation. Thus, to ask about whether sport hunting is a right thing is to ask about the historical evolution of the standards of this practice and, of equal importance, about the future direction of these standards with regard to the land ethic. List is in philosophy at the State University of New York, Plattsburgh, NY. (EE)

List, Charles J. "The Virtues of Wild Leisure." Environmental Ethics 27 (2005):355-373. The land ethic of Aldo Leopold has increasingly received attention as an example of an environmental virtue ethic. However, an important remaining question is how to cultivate and transmit environmental virtues. The answer to this question can be found in the pursuit of wild leisure. The classical view of leisure primarily as articulated in Aristotle's Politics provides a good starting point for an examination of wild leisure. Leopold thought wild leisure was important and associated it with his land ethic. Leopold's view of wild leisure focused on the role of perception in ecological education and the habituation of virtue. The classical virtue of moderation when habituated by wild leisure becomes the central virtue required by an ecological conscience. Wild leisure educates just those intellectual and scientific virtues necessary for refined perception and prudence. These virtues provide connections between good citizenship and land citizenship. (EE)

List, Charles. "On the Moral Distinctiveness of Sport Hunting." Environmental Ethics 26(2004):155-169. Although controversy concerning the morality of hunting is generally focused on sport hunting, sport hunting itself is not a morally distinctive kind of hunting. The understanding of hunting in general needs to be supplemented with reference to the goods which hunting seeks. Attempts to draw a moral distinction between sport and subsistence hunting are inadequate and historically suspect. Likewise, trying to establish sport hunting as morally distinctive by emphasizing its similarities to other sports also fails. Nevertheless, there are standards accepted by hunters that support ethical judgments about hunting. Ethical hunting requires reentry into a community of nonhuman beings governed by ecology and evolution, not human constructs, the development of virtues such as tenacity, courage, moderation, and discipline, and the achievement of a heightened respect for the biotic community in which the hunt takes place. By means of such standards, we may yet be able to determine what good hunting is even though we are unable to determine whether sport hunting is good. (EE)

List, Peter C., ed. Environmental Ethics and Forestry: A Reader. Philadelphia: Temple University Press, 2000. Paperback. 364 pages. The most comprehensive and concentrated mixture of science and conscience in forestry and philosophy anywhere available. During the last quarter century both forestry and philosophy have been rethinking their foundations; a principal focus is values carried by nature. A foreground conclusion of the contributors is that forestry needs philosophy to formulate an ethic, a background conclusion is that philosophy needs forestry to do the same. Throughout, here is ethics in practice.

Part 1: Ethical Systems in Forestry

1. THE ECONOMIC RESOURCE MODEL OF FORESTS AND FORESTRY

* Bernhard Fernow, Forest and Forestry Defined.

* Gifford Pinchot, Principles of Conservation.

* Gifford Pinchot, The Use of the National Forests.

2. JOHN MUIR ON THE PRESERVATION OF THE WILD FORESTS OF THE WEST

* John Muir, The American Forests.

3. ALDO LEOPOLD'S LAND ETHIC IN FORESTRY

* Aldo Leopold, The Land Ethic.

Part 11: Two Philosophical Issues in Forestry Ethics

4. MULTIPLE VALUES IN FORESTS

* Holmes Rolston III, Values Deep in the Woods.

* Holmes Rolston III, Aesthetic Experience in Forests.

5. THE RIGHTS OF TREES AND OTHER NATURAL OBJECTS

* Robin Attfield, The Good of Trees.

* Lawrence E. Johnson, Holistic Entities--Species.

* Lawrence E. Johnson, Ecointerests and Forest Fires.

Part III: Contemporary Forestry Ethics.

6. BASIC PRINCIPLES IN FORESTRY ETHICS

* Michael McDonald, First Principles for Professional Foresters.

* Paul M. Wood, "The Greatest Good for the Greatest Number": Is This a Good Land-Use Ethic?

* James E. Coufal, Environmental Ethics: Cogitations; and Ruminations of a Forester.

* The Ecoforestry Declaration of Interdependence.

7. CODES OF ETHICS IN FORESTRY, FISHERIES, AND WILDLIFE BIOLOGY

- * Code of Ethics for Members of the Society of American Foresters.
- * Code of Ethics and Standards for Professional Conduct for Wildlife Biologists, The Wildlife Society.
- * Code of Practices, American Fisheries Society.
- * Code of Ethics, Oregon Chapter, American Fisheries Society.
- * A Code of Ethics for Government Service.
- * The Ecoforester's Way.

8. ADOPTING A LAND ETHIC IN THE SOCIETY OF AMERICAN FORESTERS

- * James E. Coufal, The Land Ethic Question.
- * Norwin E. Linnartz, Raymond S. Craig, and M. B. Dickerman, Land Ethic Canon Recommended by Committee.
- * Holmes Rolston III and James Coufal, A Forest Ethic and Multivalue Forest Management: The Integrity of Forests and of Foresters Are Bound Together.
- * Raymond S. Craig, Further Development of a Land Ethic Canon.
- * Raymond S. Craig, Land Ethic Canon Proposal: A Report from the Task Force.

9. ADVOCATING NEW ENVIRONMENTAL ETHICS IN PUBLIC NATURAL RESOURCE AGENCIES

- * Kristin Shrader-Frechette, Ethics and Environmental Advocacy.
- * AFSEEE Vision: Strategy for Forest Service Reform.
- * Jeff DeBonis, Speaking Out: A Letter to the Chief of the U.S. Forest Service.
- * F. Dale Robertson, Chief Robertson Responds.
- * On Speaking Out: Fighting for Resource Ethics in the BLM: Whistleblower Spills Beans on North Kaibab.
- * A Combat Biologist Calls It Quits: An Interview with Al Espinosa.
- * Cheri Brooks, Enough Is Enough! A Tongass Timber Beast Puts His Foot Down.

10. ETHICAL ISSUES IN GLOBAL FORESTRY

- * James L. Bowyer, Responsible Environmentalism: The Ethical Features of Forest Harvest and Wood Use on a Global Scale.
- * Alastair S. Gunn, Environmental Ethics and Tropical Rain Forests: Should Greens Have Standing?
- * Doug Daigle, Globalization of the Timber Trade.

11. NEW FORESTRY, NEW FOREST PHILOSOPHIES

- * Alan G. McQuillan, Cabbages and Kings: The Ethics and Aesthetics of New Forestry.
- * Stephanie Kaza, Ethical Tensions in the Northern Forest.
- * Alan Drengson and Duncan Taylor, An Overview of Ecoforestry: Introduction.

EPILOGUE

- * Kathleen Dean Moore, Traveling the Logging Road, Coast Range. (v.11,#4)

Liszka, James Jakob, "The narrative ethics of Leopold's Sand County Almanac," Ethics and the Environment 8(no. 2, 2003):42-70. There is a normative argument present throughout the Sand County Almanac. In fact the shack stories may be more persuasive, with a subtlety and complexity not available in his prose "Land Ethic." This paper develops a narrative ethics methodology gleaned from rhetoric theory, and current interest in narrative ethics among literary theorists, in order to discern the normative underpinnings of the stories in Part 1. The narrative ethics approach sidesteps the need to ground the land ethic in ethical theory--which has been a reconstructive and problematic task for the philosophical interpreters of Leopold--and suggests, instead, that it emerges in Leopold's very effort to narrate his, professional, personal, and practical experience with nature. This involves examining the stories in terms of their emotional, logical and performative aspects. The result is an analysis that shows not only how these stories express normative claims, but also justify them. In the narratives, individuals are shown not merely to be means to the ecological whole, but the focus of sympathy and concern, in a manner that demands their good should also be an object of moral consideration. Liszka is in philosophy, University of Alaska, Anchorage. (E&E)

Liu, Jianguo, et al, "Protecting China's Biodiversity," Science 300(23 May 2003)1240-1241. China has over 30,000 species of vascular plants (behind only Brazil and Columbia) and perhaps half are endemics, including many archaic lines. China's biodiversity suffers from the explosive increase in the intensity and extent of human activities. Rangelands are severely overgrazed, wetlands are shrinking rapidly, and invasive species are increasingly a serious problem. Poaching of plants and wildlife is a problem. China has established 1,757 national and local nature reserves, about 13% of the nation's area, remarkable achievements given China's population and the pressing need for development. Most reserves are in the poorer areas. But the entire nature reserve system faces serious challenges. Liu is in fisheries and wildlife, Michigan State University, and many of the authors are Chinese.

Livesey, Sharon M and Kearins, Kate, "Transparent and Caring Corporations? A Study of Sustainability Reports by The Body Shop and Royal Dutch/Shell", Organization and Environment, 15, (No. 3, 2002): 233-58. This article analyzes sustainability values reports published by The Body Shop International and by the Royal Dutch/Shell Group. The authors show how corporate discourses expressed in these precedent-setting texts both reflect and influence sociopolitical struggle over the meanings and practices of sustainable development. Specifically, the authors examine metaphors of transparency and care used to describe corporate rationales for increasing stakeholder communication, including reporting. Drawing on distinct discursive domains of business accountancy and personal ethics and sentiment, these metaphors promise to reconstruct the interface between the firm and society. Exploring the quite different assumptions on which each of these metaphors relies and their implications for corporate practices of sustainable development, the authors consider whether sustainability values reporting and the dialogue that it claims to facilitate can promote more democratic and socially and environmentally responsive corporate decision making, even as they impose new forms of managerial control. Livesey is an associate professor of communication at Fordham University's Graduate School of Business in New York. Kearins

Lo, Yeuk-Sze . "Natural and Artifactual: Restored Nature as Subject." Environmental Ethics 21(1999):247-266. It has been argued that human restoration of nature is morally problematic because artificially restored natural entities are artifacts, which are ontologically different from natural entities and hence essentially devoid of the moral standing that natural entities have. I discuss the alleged assimilation of restored natural entities to artifacts, and argue that it does not follow from the ontological differences, if any, between the artifactual and the natural that the former is morally inferior to the latter. This defense against the devaluation of restored natural entities is aimed at narrowing the ethical gap between the wild and the tamed, which is often endorsed by ecocentric environmental ethics. Loaharanu, Paisan & Ahmed, Mainuddin, "Advantages and Disadvantage of the Use of Irradiation for Food Preservation", *Journal of Agricultural and Environmental Ethics* 4(1991):14-30. Food irradiation is a physical method of processing food (e.g. freezing, canning). It has been thoroughly researched over the last four decades and is recognized as a safe and wholesome method. It has the potential both of disinfecting dried food to reduce storage losses and disinfecting fruits and vegetables to meet quarantine requirements for export trade. Low doses of irradiation inhibit spoilage losses due to sprouting of root and tuber crops. Food-borne diseases due to contamination by pathogenic microorganisms and parasites of meat, poultry, fish, fishery products and spices are on the increase. Irradiation of these solid foods can decontaminate them of pathogenic organisms and thus provide safe food to the consumer. Irradiation can successfully replace the fumigation treatment of cocoa beans and coffee beans and disinfest dried fish, dates, dried fruits, etc. One of the most important advantages of food irradiation processing is that it is a cold process which does not significantly alter physico-chemical characters of the treated product. It can be applied to food after its final packaging. Similar to other physical processes of food processing, (e.g. canning, freezing), irradiation is a capital intensive process. Thus, adequate product volume must be made available in order to maximize the use of the facility and minimize the unit cost of treatment. Lack of harmonization of regulations among the countries which have approved irradiated foods hampers the introduction of this technique for international trade. Action at the international level has to be taken in order to remedy this situation. One of the important limitations of food irradiation processing is its slow acceptance by consumers, due inter alia to a perceived association with radioactivity. The food industry tends to be reluctant to use the technology in view of uncertainties regarding consumer acceptance of treated foods. Several market testing and consumer acceptance studies have been carried out on food irradiation in recent years. These studies showed that, if the safety and the benefits of food irradiation were properly explained, the consumers were willing to accept irradiated foods. Considering its potential role in the reduction of post-harvest losses, providing safe supply of food and overcoming quarantine barriers, food irradiation has received wider government approvals during the last decade. There is also a trend towards increased commercialization of irradiated food. Currently, there are 47 irradiation facilities in some 23 countries being used for treating foods for commercial purposes.

Lobell, David B. Marshall B. Burke, Claudia Tebaldi, Michael D. Mastrandrea, Walter P. Falcon, and Rosamond L. Naylor. "Prioritizing Climate Change Adaptation Needs for Food Security in 2030." *Science* Vol. 319, no. 5863 (1 February 2008): 607-10. Some of the most profound impacts of climate change over the next few decades will be on agricultural and food systems. South Asia and Southern Africa will suffer failures in several crops that are important to large food-insecure populations—unless investments are now made in improving agricultural adaptation to climate change. Millions of hungry people subsist on what they produce. If climate change reduces production, and populations continue to increase, there will be much more hunger. Uncertainties vary widely by crop, and priorities will greatly depend on the risk attitudes of investment institutions. The complications include rising oil prices, globalization of the grain market, biofuel demands, and rising per capita consumption in India and China. Lobell is in the Food Security and Environment Program at Stanford University. For commentary, see "Food Security Under Climate Change" by Molly E. Brown and Christopher C. Funk (*Science* Vol. 319, no. 5863 (1 February 2008): 580-81).

18(1996):265-278. I develop a general framework for natural and human values based on the position that end value is constructed by persons, but not wholly referent to them, identify and analyze three hierarchically related levels of end value in relation to the functional values which support them and the held and ascribed values generated by entities possessing teleological value, use this framework to indicate the context in which economic values should be located, and assess the implications of the framework for environmental policy and future valuation work. Lockwood is at the Johnstone Centre of Parks, Recreation, and Heritage, Charles Sturt University, Australia. (EE)

Lockwood, Michael. "Humans Valuing Nature: Synthesising Insights from Philosophy, Psychology and Economics." Environmental Values 8(1999):381-401. ABSTRACT: A rational process for assessment of environmental policy options should be based on an appreciation of how humans value nature. Increased understanding of values will also contribute to the development of appropriate ways for us to relate to and manage natural areas. Over the past two decades, environmental philosophers have examined the notion that there is an intrinsic value in nature. Economists have attempted to define and measure the market and nonmarket economic values associated with decisions concerning natural areas. Psychologists have tried to assess the extent to which people believe in an intrinsic value in nature, and have also begun to work with economists to improve nonmarket valuation techniques. I briefly review the contributions made to our understanding of natural area value by environmental philosophy, psychology and economics, and develop a model that integrates insights from these disciplines. Components in the model include cognitions, held values, assigned values and various modes of value expression. I make recommendations for future validation, development and use of the model. KEYWORDS: Intrinsic value, value expression, integrated evaluation. Michael Lockwood, Johnstone Centre Charles Sturt University PO Box 789, Albury, NSW 2640, Australia. (EV)

Lodahl, Michael E., "'The Whole Creation Groans': Is There a Distinctively Wesleyan Contribution to an Environmental Ethic?" Loftin, Robert W., "The Medical Treatment of Wild Animals," Environmental Ethics 7(1985):231-239. The medical treatment of wildlife can only be justified from a perspective of animal rights individualism. Genuine environmental concern is for species and ecosystems, not individual animals. (Katz, Bibl # 1)

Loftin, Robert and Klein, Ellen, "Hunting" (Animal Welfare and Rights), Encyclopedia of Bioethics, revised ed. (New York: Macmillan Library Reference, Simon and Schuster 1995), 187-90. (v6,#2)

Loftin, Robert W. "The Morality of Hunting." Environmental Ethics 6(1984):241-50. In recent years, philosophers have begun to devote serious attention to animal rights issues. Most of the attention has focused on factory farming and animal experimentation. While many of the arguments used to justify sport hunting are shown to be spurious, the paper defends sport hunting on utilitarian grounds. The loss of sport hunting would also mean the loss of a major political pressure group working for the benefit of wildlife through the preservation of habitat. Peter Singer argues that "the shooting of a duck does not lead to its replacement by another." I argue that, on the contrary, the shooting of a duck leads to the production of other ducks and other life forms that are not shot at. Loftin is at the Philosophy Dept., University of North Florida, Jacksonville, FL. (EE)

Loftin, Robert W. Review of The Rights of Nature: A History of Environmental Ethics. Environmental Ethics 12(1990):83-85.

Loftin, Robert W. "The Medical Treatment of Wild Animals." Environmental Ethics 7(1985):231-39. The medical treatment of wild animals is an accepted practice in our society. Those who take it upon themselves to treat wildlife are well-intentioned and genuinely concerned about their charges. However, the doctoring of sick animals is of extremely limited value and for the most part based on biological illiteracy. It wastes scarce resources and diverts attention from more worthwhile goals. While it is not wrong to minister to wildlife, it is not right either. The person who refuses to do so has not violated any moral duty and is not necessarily morally callous. The treatment of wildlife is based on the mistaken belief that value lies in individual wild animals rather than the entire ecosystem. The genuine concern of those who doctor wild animals should be channeled into more constructive directions. Loftin is at the Philosophy Dept., University of North Florida, Jacksonville, FL. (EE)

Loftin, Robert W., "The Morality of Hunting," Environmental Ethics 6(1984):241-250. A defense of sport hunting on utilitarian grounds. Sport hunters are interested in preserving habitats, and thus are inclined to support environmental causes. (Katz, Bibl # 1)

Loftin, Robert W. Review of The American Hunting Myth. By Ron Baker. Environmental Ethics 9(1987):87-90.

Loftin, Robert W., "Psychical Distance and the Aesthetic Appreciation of Wilderness." International Journal of Applied Philosophy 3, no. 1 (1986): 15-19. Wilderness must be approached and entered at the right "distance" for it to be appreciated, just as a work of art must be seen from the right distance. One cannot appreciate wilderness through pictures; one must enter it, illegally if necessary, to reduce psychical

distance and to gain a full wilderness experience. (Katz, Bibl # 1)

Loftin, Robert W. "Scientific Collecting." Environmental Ethics 14(1992):253-64. Scientists often collect (kill) organisms in pursuit of human knowledge. When is such killing morally permissible? I explore this question with particular reference to ornithology and against the background of animal liberation ethics and a land ethic, especially Mary Anne Warren's account that finds the two ethics complementary. I argue that the ethical theories offered provide insufficient guidance. As a step toward the resolution of this serious problem, I offer a set of criteria to determine when collecting is morally permissible. Loftin is at the Philosophy Dept., University of North Florida, Jacksonville, FL. (EE)

Loftin, Robert W. Review of The Arrogance of Humanism. By David Ehrenfeld. Environmental Ethics 3(1981):173-76.

Loftis, J. Robert. 2005. "Germ Line Enhancement of Humans and Nonhumans." Kennedy Institute of Ethics Journal 15 (1):57-76. The current difference in attitude toward germ line enhancement in humans and nonhumans is unjustified. Society should be more cautious in modifying the genes of nonhumans and more bold in thinking about modifying our own genome. I identify four classes of arguments pertaining to germ line enhancement: safety arguments, justice arguments, trust arguments, and naturalness arguments. The first three types are compelling, but do not distinguish between human and nonhuman cases. The final class of argument would justify a distinction between human and nonhuman germ line enhancement; however, this type of argument fails and, therefore, the discrepancy in attitude toward human and nonhuman germ line enhancement is unjustified. Loftis is in philosophy, St. Lawrence University.

Loftis, J. Robert, "Three Problems for the Aesthetic Foundations of Environmental Ethics," Philosophy in the Contemporary World 10 (no. 2, Fall-Winter 2003):41-50. A critical look at aesthetics as the basis for nature preservation, presenting three reasons why we should not rely on aesthetic foundations to justify the environmentalist program. First, a comparison to other kinds of aesthetic value shows that the aesthetic value of nature can provide weak reason for action at best. Second, not everything environmentalists want to protect has positive aesthetic qualities. Attempts have been made to get around this problem by developing a reformist attitude towards natural aesthetics. These approaches fail. Third, development can be as aesthetically positive as nature. If it is simply beauty we are looking for, why can't the beauty of a well-constructed dam or a magnificent skyscraper suffice? Loftis is in philosophy, University of Alabama. (v.14, #4)

Logan, Bernard I., "Government Expenditures on Imported Inputs and the Goals of Food Self-Sufficiency and Food Security in the Southern African Development Co-ordination Conference", Journal of Agricultural Ethics 2(1989): This study is a broad examination of the relationship between government expenditures on imported inputs and the performance of the domestic food subsector. Because much data on government spending and agricultural production in Africa are unavailable, and those in published form are of suspect validity, the study is undertaken largely as a conceptual overview. Logan is in geography at the University of Georgia, Athens. (v6,#3)

Logsdon, Gene. At Nature's Pace. Foreword by Wendell Berry. New York: Pantheon Books, 1994. 208 pp. \$23 hardbound. Formerly an editor for Farm Journal, Logsdon is an ardent defender of the small traditional farm (the farm of fifty years ago), an honor he shares with Wendell Berry. Logsdon farms thirty acres in Ohio, and has written twelve books and hundreds of articles. The small farm is not dead, he argues; rather, the future will have more farmers, not fewer. Farms will be ecologically sane and community-interdependent. The error of the past was that farmers tried to live like city folks. The Amish

have proved that farming is a decent living.

Lohman, David J., David Bickford, and Navjot S. Sodhi. "The Burning Issue." *Science* Vol. 316, no. 5823 (20 April 2007): 376. Widespread burning of using fire to clear land causes widespread air pollution in Southeast Asia. The burning is both by large scale commercial tree plantations and by numerous small farmers. Often illegal, the burning continues nonetheless, with both environmental degradation and harm to human health.

Loker, Cynthia A., Daniel J. Decker, R. Bruce Gill, Thomas D. I. Beck, and Len H. Carpenter, The Colorado Black Bear Hunting Controversy: A Case Study of Human Dimensions in Contemporary Wildlife Management. Ithaca, NY: Human Dimensions Research Unit, Cornell University, February 1994. HDRU Series No. 94-4. 56 pages. In November 1992, Colorado voters in public referendum by 2-1 banned black bear hunting in the spring, and the use of bait or dogs year round. There were four periods in the controversy, with the Colorado Wildlife Commission (a publicly appointed board) generally being inadequately sensitive to growing public concern, trying to conciliate by altering hunting season dates to reduce the kill of nursing females in the spring, while continuing to support the hunt. The Colorado Division of Wildlife made recommendations that the Wildlife Commission refused to hear. Biologists maintained that the bear population was not adversely affected by the hunt; hunters said they would not be bullied around by people who were really opposed to all hunting. The agency that was mandated to represent all citizens' interest in wildlife disproportionately represented hunter's interests, forcing citizens to take their concern to public referendum. There is also available an additional report that analyzes the views of differing segments of the voting public in this referendum. Copies from Human Dimensions Research Unit, Department of Natural Resources, Fernow Hall, Cornell University, Ithaca, NY 14853. Loker and Decker are with that unit, Gill, Beck, and Carpenter are with the Colorado Division of Wildlife. (v5,#2)

Løkke, Søren, and Per Christensen, "The Introduction of the Precautionary Principle in Danish Environmental Policy: The Case of Plant Growth Retardants," *Journal of Agricultural and Environmental Ethics* 21(2008):229-247. We investigate the Precautionary Principle (PP) in action. Precaution is a fairly new concept in environmental policy. It emerged back in the 1960s but did not consolidate until the 1980s, as it formed part of the major changes taking place in environmental policies at that time. The PP is examined in three contexts. Firstly, we look at the meaning of the concept and how it is disseminated through the media and public discourses to the political arenas of Denmark. Then we examine how the idea is adopted to the political level. Thirdly, we look briefly at the first Danish translation of the principle into a practical context, which includes translations into concrete scientific practices. It is concluded that if the PP shall be more than a simple "idea" or a frequently used "term," emphasis must be put on the transformation of the concept into concrete practices, like e.g., the alternative testing regimes that we show in the case of plant growth-retarding pesticides presented in this paper. The authors are with the Environmental Assessment and Governance Group, Department of Development and Planning, Aalborg University, Aalborg, Denmark.

Lombardi, Louis G. "Inherent Worth, Respect, and Rights." Environmental Ethics 5(1983):257-70. Paul W. Taylor has defended a life-centered ethics that considers the inherent worth of all living things to be the same. I examine reasons for ascribing inherent worth to all living beings, but argue that there can be

various levels of inherent worth. Differences in capacities among types of life are used to justify such levels. I argue that once levels of inherent worth are distinguished, it becomes reasonable to restrict rights to human beings. Lombardi is at the Philosophy Department, Lake Forest College, Lake Forest, IL. (EE)

Lombardi, Louis G., "Inherent Worth, Respect, and Rights," Environmental Ethics 5(1983):257-270. A further discussion of "biocentrism" based on the idea that there can be different levels of "intrinsic" or "inherent" worth, thus leading to different moral principles regarding different life forms. (Katz, Bibl # 1)

Lomborg, Bjørn, The Skeptical Environmentalist. See "Skeptical Environmentalist Labeled 'Dishonest'," Science 299 (1/17 /03):326. A Danish panel has judged Bjørn Lomborg's The Skeptical Environmentalist to be "scientifically dishonest." The Danish Research Agency's Committee on Scientific Dishonesty received numerous complaints and as a result mounted a six month investigation of the book. It concluded that Lomborg was not deliberately deceptive but that he was guilty of "systematic one-sidedness." "Lomborg is highly selective in his use of references in practically every field he covers. This is not in accord with scientific standards." The committee chair was Hans Henrik Brydensholdt, a high-court judge. One commentator said: it's "an unusually hard ruling by a committee known for being immensely difficult to convince of any wrongdoing."

Lomborg, Bjørn. The Skeptical Environmentalist: Measuring the Real State of the World. Reviewed in Environmental Ethics 25(2003):423-426. (EE)

Lomborg, Bjørn. *Cool It: The Skeptical Environmentalist's Guide to Global Warming*. New York: Alfred A. Knopf, 2007. There is also a rather different United Kingdom version published by London: Marshall Cavendish and Cyan Communications, 2007. "Global warming is happening; the consequences are important and mostly negative." Lomborg conceded he has "cooled" (moderated) some of the views he originally expressed in *The Skeptical Environmentalist* (2001). But he does take aim at overheated rhetoric on global warming. He also he finds that there may be benefits to global warming: fewer persons may die from cold winters than die from overheated summers. He argues that the most cost-effective way of dealing with global warming is to spend modest amounts to reduce global warming now and ramp up expenditures later, when global wealth is greater. Lomborg is an adjunct professor at the Copenhagen Business School. See the review "Act Now (But How?)" by William F. Ruddiman (*Science* Vol. 319, no. 5861 (18 January 2008): 285).

Lomborg, Bjørn. *Cool It: The Skeptical Environmentalist's Guide to Global Warming*. New York: Alfred A. Knopf, 2007. Cool the rhetoric, mostly, with some plans also to cool the planet. "The broader problem with the climate-change concern: once you look closely at the supporting data, the narrative falls apart" (p. 4). This is side-by-side with: "Global warming is real and man-made. It will have a serious impact on humans and the environment toward the end of this century" (p. 8).

Lomolino is in environmental and forest biology, SUNY College of Environmental Science and Forestry. Heaney is curator of mammals, Field Museum, Chicago.

Long, D. Stephen, Divine Economy: Theology and the Market. London: Routledge, 2000. A critique of contemporary capitalism and an argument that it must be baptized with Christian (if not Catholic) presumptions about the moral life. There are no objective perspectives (as postmodernists argue). Competing descriptions of the world cannot be objectively demonstrated to be either true or false. Rather, each narrator attempts to "out-narrate" the others and thereby persuade the listener. Scientific rationality, especially if claimed for the contemporary worldview, economics included, is but one tradition among others and should not have authority over modes of perception embodied in other traditions. Long argues

(or at least narrates a story) that embodies concern for justice and community in economics, empowered by Christian vision, and hopes to persuade that this is a more attractive story to live by. Long teaches at Garrett-Evangelical Theological Seminary. (v.13,#2)

Lord, Charles P. and Willian A. Shutkin. "Environmental Justice and the Use of History." Boston College Environmental Affairs Law Review 22 (no. 1, Fall 1994): 1-26. An analysis of two communities fighting for environmental justice reveals that a flawed or careless approach to history is often a root cause of environmental injustice. In each community, the legal system has perpetuated environmental injustice by misreading or disregarding that community's history. Communities fighting environmental injustice must vigorously prepare and proclaim their own histories and must urge courts and other decisionmakers to examine history carefully and justly. The two communities are one in inner-city South Boston and the Abenaki, a Native American tribe of northern New England. Lord and Shutkin are Visiting Scholars at Boston College Law School. (v6,#1)

And, in addition, you may save them from attention deficit disorder, since a study by researchers at the Human-Environment Research Laboratory at the University of Illinois at Urbana-Champaign shows that children as young as five show a significant reduction in the symptoms of attention deficit disorder when they engage with nature.

Love, Thomas F., "Ecological Niche Theory in Sociocultural Anthropology: A Conceptual Framework and an Application," American Ethnologist 4(no. 1, Feb. 1977):27-40. The concept of "ecological niche" is frequently employed in sociocultural anthropology, but there have been few systematic applications of it. Love examines the utility of the concept for the analysis of social interaction and change, with special reference to complex societies. In a small agricultural valley of north California, competition between

two status groups over a scarce resource--land--has led to displacement and changing patterns of resource use. "Niche" describes the aggregate outcome of underlying processes of competition on the individual level. Love is a sociologist at the University of California, Davis.

Lovelock, James, "The Greening of Science," pages 39-63 in Wakeford, Tom, Walters, Martin eds., Science for the Earth: Can Science Make the World a Better Place? New York: Wiley, 1995. "I firmly believe that science is badly in need of greening and that everyone, including the greens, need science, but not the kind of science we now have. We want science to return to natural philosophy and be once again its old familiar and welcome part of our culture. Science must abandon its genteel posturing and come down to Earth again quite literally. This is not easy task, it requires scientists to recognize that science has grown fat, lazy and corrupt and, like an obese atherosclerotic man, imagines that more rich food will cure his condition. That science should be in this condition is disastrous at this time in history, when more than ever we need firm guidance and a clear understanding of the Earth" (p. 39). Lovett, Gary M.; et al., "Forest Ecosystem Responses to Exotic Pests and Pathogens in Eastern North America," BioScience 56 (no.5, May 2006): 395-405 (11). The forests of eastern North America have been subjected to repeated introductions of exotic insect pests and pathogens over the last century, and several new pests are currently invading, or threatening to invade, the region. These pests and pathogens can have major short- and long-term impacts on forest ecosystem processes such as productivity, nutrient cycling, and support of consumer food webs. We identify six key features of the biology of exotic animal pests and the ecology of their hosts that are critical to predicting the general nature and severity of those impacts. Using three examples of introduced pests and pathogens in eastern forest ecosystems, we provide a conceptual framework for assessing potential ecosystem-scale effects.

Lowenthal, David, "Nature and Morality from George Perkins Marsh to the Millennium," Journal of Historical Geography 26(2000):3-27. George Perkins Marsh's Man and Nature was the first comprehensive study of human impacts on the natural environment, a remarkable work. Marsh stressed unforeseen and unintended consequences, as well as the heedless greed of technological enterprise. Despite recent tendencies to belittle Marsh's insights as derivative elitist, anthropocentric, or narrowly utilitarian, he remains modern environmentalism's pre-eminent pioneer. Lowenthal is a geographer, University College, London.

Lowenthal, David, "Environmental Conflict," Research and Exploration (National Geographic) 7(no. 3, Summer, 1991):266-275. Environmental impact issues are highly acrimonious, reflecting deep differences. Fears about species extinction, the greenhouse effect, ozone layer depletion, nuclear and other contaminants lead many to question the fundamental bases of modern entrepreneurial, technological society. We inherit outworn environmental attitudes along with often worn-out environments. The adversarial tone of environmental controversy stems from mounting evidence of the human capacity to destroy or irreversibly damage the biosphere, the complexity and uncertainty of ecological impacts and their global relationships, rising suspicions that government, industry, and even science might be impotent to contain, let alone cure, biosphere destruction. The accusatory polemics, however, make it even harder to respond appropriately to impact analyses that demand action, even if incomplete and provisional. Differing from the past, meanwhile, today all disputants find the notion of the conquest of nature deplorable. Lowenthal is in Geography, University College, London, an emeritus professor. (v5,#4)

Loy, David, "Indra's Postmodern Net," Philosophy East and West 43 (no. 3, 1993):481-510. Indra's net, a cosmological metaphor in Buddhism, with its myriad jewels each reflecting each other, symbolizes an infinitely repeated interrelationship among all the members of the cosmos. There is no beginning, no creator, no purpose, no hierarchy, no center, no privileged point, only interpenetration and mutual identity. This has ecological ramifications that fit surprisingly well with contemporary poststructuralist philosophy critiques of self-existence and self-presence, a suspicion about the theological quest for Being, an emphasis on groundlessness, the deconstruction of any transcendental significance, the rejection of truth with a capital T. Although there are differences, there are remarkable parallels between an ancient philosophical system and one of the most provocative developments in modern thought. Buddhism has something to offer a rationalized, technologized world that is rapidly devouring what remains of its own spiritual roots. Loy is in international studies at Bunkyo University, Kyoto, Japan. (v5,#4)

Loy, David R., "The Religion of the Market," Journal of the American Academy of Religion 65(1997):275-290. The discipline of economics is less a science than the theology of the religion of the market. It's god, the Market, has become a vicious circle of ever-increasing production and consumption by pretending to offer a secular salvation. The Market is becoming the first truly world religion. Loy is in International Studies, Bunkyo University, Chigasaki, Japan. (v8,#3)

Lu, B. R. and Snow, A. A., "Gene Flow from Genetically Modified Rice and Its Environmental Consequences," Bioscience 55(no. 8, August 2005): 669-678. Within the next few years, many types of transgenic rice (*Oryza sativa*) will be ready for commercialization, including varieties with higher yields, greater tolerance of biotic and abiotic stresses, resistance to herbicides, improved nutritional quality, and novel pharmaceutical proteins. Although rice is primarily self pollinating, its transgenes are expected to disperse to nearby weedy and wild relatives through pollen mediated gene flow. Sexually compatible *Oryza* species often co occur with the crop, especially in tropical countries, but little is known about how quickly fitness enhancing transgenes will accumulate in these populations and whether this process will have any unwanted environmental consequences. For example, weedy rice could become much more difficult to manage if it acquires herbicide resistance, produces more seeds, or occurs in a wider range of habitats because of the spread of certain transgenes. Rice growing countries urgently need publicly available ecological assessments of the risks and benefits of transgenic rice before new varieties are released.

Lubchenco, Jane, "Entering the Century of the Environment: A New Social Contract for Science," *Science* 279(1998):491-497. As the magnitude of human impacts on the ecological systems of the planet becomes apparent, there is increased realization of the intimate connections between these systems and human health, the economy, social justice, and national security. The concept of what constitutes "the environment" is changing rapidly. Urgent and unprecedented environmental and social changes challenge scientists to define a new social contract. This contract represents a commitment on the part of all scientists to devote their energies and talents to the most pressing problems of the day, in proportion to their importance, in exchange for public funding. The new and unmet needs of society include more comprehensive information, understanding and technologies for society to move toward a more sustainable biosphere--one which is ecologically sound, economically feasible, and socially just.

New fundamental research, faster and more effective transmission of new and existing knowledge to policy- and decision-makers, and better communication of this knowledge to the public will all be required to meet this challenge. Lubchenco's presidential address to the American Association for the Advancement of Science, February 1997, and well worth study. Implications for the use of ecology in policy, for science and advocacy, science and conscience. Lubchenco has been president of the Ecological Society of America, is an active environmentalist, and was influential in the Society's policy statement that ecological research ought be devoted neither to sustainable development nor to pure science, but to a "sustainable biosphere." She is in zoology at Oregon State University, and her election as president of the American Association for the Advancement of Science is a tribute to her impact in her field, insisting on its relevance and on scientific responsibility. Lucas, Peter, "Valuing Birds in the Bush: For Pluralism in Environmental Risk Assessment," *Environmental Values* 11(2002):177-191. It is now widely acknowledged that social theorists can make an important contribution to our understanding of environmental risk. There is however a danger that the current ascendancy of social theory will encourage a tendency to assimilate issues around environmental risk to those at stake in entrenched debates between realist and constructivist social theorists. I begin by citing a recent example of this trend, before going on to argue that framing the issues in terms of a monism/pluralism dichotomy would make for a more informative analysis. Noting that realists and constructivists can make common cause against risk monism, I turn, in the second half of the paper, to setting out a positive case for risk pluralism. Citing some fictional examples of risk behavior, I show how different individuals might rationally adopt different perspectives on the same risk. I conclude by exploring some implications of the truth of risk pluralism for two current approaches to environmental decision-making (which I term, respectively, the "teleological-pluralistic" approach, and the "economic-monistic" approach). I argue that the importance of risk pluralism lies in its capacity to

highlight the shortcomings of the latter approach. (EV)

Lucas, Peter, This is not a Planet: Ethics and Environmentalism in the Age of the World Picture, Master's Thesis, Department of Philosophy, Lancaster University, September 1994. (v7,#1)

Lucas, Peter. "Environmental Ethics: Between Inconsequential Philosophy and Unphilosophical Consequentialism." Andrew Light and Eric Katz commend environmental pragmatism as a framework of choice for a more pluralistic, and (consequently) more practically effective environmental ethics. There is however a prima facie conflict between the promotion of pluralism and the promotion of pragmatism. I consider two different routes by which Light has attempted to resolve this conflict. Light's first strategy involves distinguishing philosophical from metaphilosophical forms of pragmatism, locating its "metatheoretically pluralist" potential in the latter. I argue that the distinction collapses, leaving the conflict unresolved. Light's second strategy involves interpreting metatheoretical pluralism as a form of practical compatibilism. I argue that metatheoretical pluralism, thus interpreted, holds no remedy for the perceived practical ineffectiveness of the field. Not only would it fail to qualify as a viable form of pluralism, but its widespread adoption would actively undermine the real work of environmental ethics: that of fostering a sense of the special significance of enlightened and principled action in defense of environmentalist ideals, in the face of the consequentialism which dominates global environmental decision making. Ludwig, Donald, Ray Holborn, and Carl Waters, "Uncertainty, Resource Exploitation, and Conservation: Lessons from History," Science 260 (April 2, 1993):17, 36. Short, excellent, powerful argument that everyone interested in environmental ethics and biological conservation should read. "There are currently many plans for sustainable use or sustainable development that are founded upon scientific information and consensus. Such ideas reflect ignorance of the history of resource exploitation and misunderstanding of the possibility of achieving scientific consensus concerning resources and the environment. Although there is considerable variation in the detail, there is remarkable consistency in the history of resource exploitation: resources are inevitably overexploited, often to the point of collapse or extinction. We suggest that such consistency is due to the following common features: (i) Wealth or the prospect of wealth generates political and social power that is used to promote unlimited exploitation of resources. (ii) Scientific understanding and consensus is hampered by the lack of controls and replicates, so that each new problem involves learning about a new system. (iii) The complexity of the underlying biological and physical systems precludes a reductionist approach to management. Optimal levels of exploitation must be determined by trial and error. (iv) Large levels of natural variability mask the effects of overexploitation. Initial overexploitation is not detectable until it is severe and often irreversible." (v4,#1)

Lueck, Thomas J., and Jennifer Lee, "No Fighting the Co-op Board, Even With Talons," New York Times, December 11, 2004, p. A1, B14. A famous red tail hawk, known as Pale Male, with his nest, has been removed from an uptown Manhattan apartment building, despite nesting there since 1991. The male hawk, and several different female mates, had sired 26 chicks, 23 of which lived to fledging. Protestors included the entertainer Mary Tyler Moore, who lives in the fancy apartment building. Understanding how society becomes aware of environmental dangers and why irrational responses tend to appear must precede any ethics of environmental responsibility. (v1,#1)

Luke, Brian. "A Critical Analysis of Hunters' Ethics." Environmental Ethics 19(1997):25-44. I analyze the "Sportsman's Code," arguing that several of its rules presuppose a respect for animals that renders hunting a prima facie wrong. I summarize the main arguments used to justify hunting and consider them in relation to the prima facie case against hunting entailed by the sportsman's code. Sport hunters, I argue, are in a paradoxical position--the more conscientiously they follow the code, the more strongly their behavior exemplifies a respect for animals that undermines the possibilities of justifying hunting altogether. I consider several responses, including embracing the paradox, renouncing the code, and renouncing hunting. Luke is in philosophy, University of Dayton, OH. (EE)

Luke, Brian. *Brutal: Manhood and the Exploitation of Animals*. Urbana: University of Chicago Press, 2007. Luke examines the gender divide over the treatment of animals by exposing the central role of masculinity in systems of animal exploitation. He synthesizes activist experience, empirical research, and philosophical analysis to develop a theory of how exploitative institutions merely support a particular construction of manhood instead of promoting human flourishing.

Luke, Timothy W., "'Deep Ecology: Living as if Nature Mattered': Devall and Sessions on Defending the Earth", Organization and Environment, 15, (No. 2, 2002): 178-86. The theory of deep ecology has had a profound effect on many environmental political movements over the past generation. While this notion was first advanced by Arne Naess in Western Europe, deep ecology found its broadest and most influential popularization, especially in North America, in the work of Bill Devall and George Sessions. Their 1985 work 'Deep Ecology: Living as if Nature Mattered', outlines their vision of deep ecology, and as an important source for anyone interested in the ethics and politics of deep ecology, is summarized and evaluated here. Luke, Timothy W. "SUVs and the Greening of Ford: Reimagining Industrial Ecology as an Environmental Corporate Strategy in Action", Organization and Environment 14 (No. 3, September 2001) pp.311-35. Ford Motor Company, in one of the more remarkable developments in business management in decades, recently began to remake their image by moves towards more ecological and sustainable practices. As this cultural critique shows, however, the continued production of SUVs, a highly profitable but possibly anti-ecological pursuit, is not the only contradiction in Ford's quest to reinvent itself as a green business leader. Its core belief (that the world can and should accommodate the desires of mobile consumers, most of whom are both auto enthusiasts and environmentalists) serves as a severely limiting condition. Ford's innovations are noteworthy, but its approach falls short of what is needed from big business to help create a more ecological society. Luke is a University Distinguished Professor of Political Science at Virginia Polytechnic Institute and State University in Blacksburg, Virginia. (v.13,#2)

Lulka, David, " Social splinters and cross-cultural leanings: a cartographic method for examining environmental ethics," *Journal of Agricultural and Environmental Ethics* 21(2008):275-296. This paper combines the interests of geography, anthropology, and philosophy in order to examine the factors that affect environmental ethics. In particular, this paper examines some of the geographical variables that impact tribal attitudes toward bison in the contemporary world. These factors influence the position of bison within the environmental and agricultural landscape. An emphasis is placed upon networks, places, and movement in order to show how these variables redefine what is acceptable and ethical with regard to relations with nonhuman animals. In alternating fashion, the tribal networks discussed include diasporic movements, food chains, and individual life paths. In some cases, these networks distinguish tribal communities from non-tribal society while also distinguishing tribes from one another. In other instances,

these networks bring tribal and non-tribal communities into greater agreement. This cartographic ethic differs substantially from modern scientific proscriptions, which characterize ethics in universal terms. Lulka is in the Department of Geography, San Diego State University, California.

Lund, Vonne, Raymond Anthony, and Helena Rocklinsberg, "The Ethical Contract as a Tool in Organic Animal Husbandry," Journal of Agricultural and Environmental Ethics 17(2004):23-49. This article explores what an ethic for organic animal husbandry might look like, departing from the assumption that organic farming is substantially based ecocentric ethics. We argue that farm animals are necessary functional partners in sustainable agroecosystems. This opens up additional ways to argue for their moral standing. We suggest an ethical contract to be used as a complementary to the ecocentric framework. We expound the content of the contract and end by suggesting how to apply this contract in practice. The contract enjoins us to share the wealth created in the agroecosystem (our joint contributions) by enjoining us to care for the welfare and needs of the individual animal, and to protect them from exploitation (just as human co-workers should not be exploited). The contract makes promoting good animal welfare a necessary condition for benefiting farm animals. Animals for their part are guaranteed coverage under the contract so long as they continue to contribute to the system with products and services. Keywords: animal welfare, contract ethics, organic animal husbandry, organic farming, organic livestock production. The authors are in the Department of Animal Environment and Health, Swedish University of Agricultural Sciences, Skara, Sweden. (JAEE)

Lund, Vonne, Sven Hemlin and James White, "Natural Behavior, Animal Rights, or Making Money - A Study of Swedish Organic Farmers' View of Animal Issues," Journal of Agricultural and Environmental Ethics 17(2004):131-156. A questionnaire study was performed among Swedish organic livestock farmers to determine their view of animal welfare and, other ethical issues in animal production. The questionnaire was sent to 56.5% of the target group and the response rate was 75.6%. A principal components analysis (exploratory factor analysis) was performed to get a more manageable data set. A matrix of intercorrelations between all pairs of factors was computed. The factors were then entered into a series of multiple regression models to explain five dependent variables. Respondents were well educated and had long experience of farming. 81% were full-time farmers. They generally had a very positive attitude towards organic animal husbandry. They considered allowing animals their natural behavior a central aim, which is in accordance with organic philosophy. Farmers tended to be less approving of concepts like animal rights, dignity, and intrinsic value. When analyzing correlations between the factors, two groups of farmers emerged that were only partially correlated, representing different attitudes and behavioral dispositions. These may be interpreted as two subpopulations of organic livestock farmers in Sweden: those who saw organic farming as a lifestyle ("pioneer attitude") and entrepreneurs, who considered making money and new challenges more important. Their view of animal welfare differed. While the pioneers considered natural behavior a key issue, this was less important to the entrepreneurs, who also had a more approving attitude towards invasive operations such as castration and were more critical of the organic standards. Keywords: animal ethics, attitude, natural behavior, organic animal husbandry, organic farming, organic livestock production, questionnaire study. The authors are at the National Veterinary Institute, Oslo, Norway. (JAEE)

Luo, Yigi et al., "Progressive Nitrogen Limitation of Ecosystem Responses to Rising Atmospheric Carbon Dioxide", BioScience 54 (no. 8, 1 August 2004):731-739(9). A highly controversial issue in global biogeochemistry is the regulation of terrestrial carbon (C) sequestration by soil nitrogen (N) availability. This controversy translates into great uncertainty in predicting future global terrestrial C sequestration. We propose a new framework that centers on the concept of progressive N limitation (PNL) for studying the interactions between C and N in terrestrial ecosystems. In PNL, available soil N becomes increasingly limiting as C and N are sequestered in long-lived plant biomass and soil organic matter. Our analysis focuses on the role of PNL in regulating ecosystem responses to rising atmospheric carbon dioxide concentration, but the concept applies to any perturbation that initially causes C and N to accumulate in organic forms. This article examines conditions under which PNL may or may not constrain net primary production and C sequestration in terrestrial ecosystems. While the PNL-centered framework has the potential to explain diverse experimental results and to help researchers integrate models and data, direct tests of the PNL hypothesis remain a great challenge to the research community.

Luoma, Jon R., "Habitat Conservation Plans: Compromise or Capitulation?" Audubon 100 (no. 1, January-February 1998):36-51. Habitat Conservation Plans, sweeping regulatory arrangements, are fast becoming the new standard for ecosystem protection. In the past four years more than 400 have been approved or set in motion. But are they a great leap forward or a sellout of endangered species? Although in principle, they protect habitat and many species at the ecosystem level, and are praised as a win-win situation, in practice skeptics worry that species protection is becoming driven less by law and science, more by the backrooms deals cut between federal bureaucrats and developers and their lawyers. Especially objectionable is the Babbitt innovation of "no surprises" clauses, which locks in the agreed arrangements for a century, once the deal is struck. For all intents and purposes, landowners are absolved of any future liability under the Endangered Species Act. Critics also complain the HCP's are rushed through without adequate study, and, under these circumstances, surprises are to be expected. In a forceful letter to Congress, 167 scientists, mostly conservation biologists, complained that the "no surprises" clause "proposes a world of certainty that does not, has not, and never will exist... because we will always be surprised by ecological systems." Luper-Foy, Steven. "Natural Resources, Gadgets and Artificial Life." Environmental Values 8(1999):27-54. ABSTRACT: I classify different sorts of natural resources and suggest how these resources may be acquired. I also argue that inventions, whether gadgets or artificial life forms, should not be privately owned. Gadgets and life-forms are not created (although the term "invention" suggests otherwise); they are discovered, and hence have much in common with more familiar natural resources such as sunlight that ought not to be privately owned. Nonetheless, inventors of gadgets, like discoverers of certain more familiar resources, sometimes should be granted exclusive but temporary control over their inventions as an incentive for making unknown items widely accessible KEYWORDS: Artificial life, patents, ownership, natural resources, intellectual property, justice.

Invertebrate species represent more than 99 of animal diversity; however, they receive much less publicity and attract disproportionately minor research effort relative to vertebrates. Nonmarine mollusks (i.e., terrestrial and freshwater) are one of the most diverse and imperiled groups of animals, although not many people other than a few specialists who study the group seem to be aware of their plight. Nonmarine mollusks include a number of phylogenetically disparate lineages and species-rich assemblages that represent two molluscan classes, Bivalvia (clams and mussels) and Gastropoda (snails, slugs, and limpets). In this article we provide an overview of global nonmarine molluscan biodiversity and conservation status, including several case studies documenting the diversity and global decline of nonmarine mollusks. We conclude with a discussion of the roles that mollusks and malacologists should play in conservation,

including research, conservation management strategies, and education and outreach.

Lydeard, Charles and Mayden, Richard L., "A Diverse and Endangered Aquatic Ecosystem of the Southeast United States," Conservation Biology 9(1995):800-805. There is an extraordinarily diverse and endangered ecosystem in the United States, the rivers and streams of Alabama and adjoining states. Relative to North America as a whole, Alabama is a highlight of biotic diversity, with much of this diversity imperiled. The biodiversity crisis is not limited to tropical forests, but is right in Americans' own backyards. Lydeard and Mayden are in the Aquatic Biology Program, Department of Biological Sciences, University of Tuscaloosa, Alabama. Lytle, Mark Hamilton. *The Gentle Subversive: Rachel Carson, Silent Spring, and the Rise of the Environmental Movement*. New York: Oxford University Press, 2007. The DDT concern was serious and launched Carson's thinking, but Carson became and was viewed as a threat because she was making a profound critique of a worldview that locates human beings at the center of the universe and the natural world at the periphery. She was calling into question the paradigm of scientific progress that defined postwar American culture. She advanced a biocentric paradigm, where humans are one among many species that interact in an intricate ecological web. Lytle also argues that Carson's nature-centered perspective was nurtured by her Presbyterian mother who taught her to observe nature closely, to love the natural world, and to return to its natural habitat whatever specimen she brought home. As an adult Carson no longer held to the Christian faith, but resented being called an atheist. "As far as I am concerned," she wrote, "there is absolutely no conflict between a belief in evolution and a belief in God as creator."

MacCleery, Douglas W., American Forests: A History of Resiliency and Recovery. Durham, NC: Forest History Society, 1994 (and earlier editions). Following two centuries of decline, the area of forest land has stabilized. Today the U.S. has about the same forest areas as in 1920. The area consumed by wildfire each year has fallen 90 percent. Populations of deer, turkey, elk, pronghorns, and many other wildlife have increased dramatically. Eastern forests have staged a major comeback. Forest growth nationally has exceeded harvest since the 1940's. Recreational use of forests has increased manyfold. Dependence of the economy on wood and wood products is as great as ever. One can wonder, however, whether questions about the quality of the forests (pine plantations vs. old growth forests) still need to be addressed. MacCleery is a professional forester with the U.S. Forest service. (v6,#4)

MacCracken, Michael C., "Climate Change Discussions in Washington: A Matter of Contending Perspectives," Environmental Values 15(2006): 381-395. The scientific evidence and understanding underpinning societal responsibility for the accelerating pace of climate change has become increasingly strong over the past hundred years. Although many nations have begun to take actions that have the potential to eventually slow the pace of change, contention over the issue continues in the United States, particularly in the nation's capital. A major cause appears to arise from different interpretations of the evidence arising from different perspectives on the issue, including those of the scientific, environmental, fossil-fuel generating, technological, economic and ethical communities. In addition, the public encounters a cacophony of intermixed perspectives from the media and elected officials. While each perspective provides some useful insights, each alone contributes to inhibiting development of the national political consensus needed to responsibly address climate change. Without leadership that balances and reconciles competing perspectives, it is unlikely that a sufficient limiting of emissions will be enacted to prevent significant changes in climate that will impose increasing challenges for those in both developing and developed nations. MacDonnell, Lawrence J. and Sara F. Bates, eds., Natural Resources Policy and Law: Trends and Directions. Washington: Island Press, 1993. \$ 19.95 paper. \$ 38.00 hardcover. Ten chapters, by, in addition to the editors, Clyde O. Martz, George Cameron Coggins, Richard C. Maxwell, A. Dan Tarlock, Joseph Sax, Charles F. Wilkinson, David Getches, and Richard J. Lazarus. With a special emphasis on new laws and important legal cases of the past decade. Contributions include: historical overview, public land law, mineral law, oil and gas law, water resources, public trust doctrine, environmental law, shifting paradigms. In recent years, the contributors variously argue, we have begun to appreciate the inherent worth of our land, air, water, a worth that is entirely unrelated to economic growth and development. The evolution of law and policy regarding natural resource and environmental issues over the past century reflects these ongoing changes in valuation. MacDonnell and Bates are at the Natural Resources Law Center, University of Colorado School of Law. (v4,#3)

MacDonnell, Lawrence J., From Reclamation to Sustainability: Water, Agriculture, and the Environment in the American West. Niwot,CO: University Press of Colorado, 1999. The American West viewed through the lens of its most contested resource: water. Western water resources have been developed beyond their sustainable capacity, resulting in overdevelopment, declining rural communities, dewatered streams incapable of supporting native species, and degraded water quality. Sustainable use of water depends on reducing the gap between diverted water and used water, restoring the functional integrity of water sources. MacDonnell is a water lawyer, and was the first director of the Natural Resources Law Center at the University of Colorado School of Law, Boulder. (v.10,#1)

MacDougall, A. Kent. "Humans as Cancer", Wild Earth 6(no.3, 1996):81-88. "A cancerous tumor continues to grow even as its expropriation of nutrients and disruption of vital functions causes its host to waste away. Similarly, human societies undermine their own long-term viability by depleting and fouling the environment. With civilization as with cancer, initial success begets self-defeating-excess." Various interpreters argue over whether this is metaphor or more literal, and many find the idea offensive. Lovelock, with his Gaia hypothesis, initially found the idea absurd, but has changed his mind. Various physicians and epidemiologists have supported the idea. "Whether as metaphor or hypothesis, the proposition that humans have been acting like malignant cancer cells deserves to be taken seriously." MacDougall is an award-winning professor emeritus of journalism at the University of California. (v7,#4)

Mace, William M., "James J. Gibson's Ecological Approach: Perceiving What Exists," Ethics and the Environment 10(2005):195-216. The purpose of this paper is to help an audience attracted to environmental philosophy get to the core of Gibson's system in a compact form and to appreciate the necessity for an account of the environment in epistemology. I hope to show that Gibson's is a consistent and scientifically progressive account of knowing that gives the environment its due and that this is not a simple matter of fiat but a call to extended scientific investigation. I stress that Gibson's work is scientifically progressive in the sense that it has consistently opened new avenues for research. If one could be assured tomorrow that Gibson was correct and his critics wrong, the ecological psychology enterprise would not have to be shut down with nothing left to do. The goal of the enterprise, certainly for Gibson, was not to be declared a winner but to open doors for discovery. Because Gibson has developed a theory of perceiving the environment, it would be worth exploring as an important topic for environmental philosophers covering a wide range of issues. It offers an intriguing, environmentally based, grounding for epistemology. Mace is in psychology, Trinity College, Hartford, CT, and founding director of the International Society for Ecological Psychology (ISEP). (Eth&Env)

Macer, Darryl R.J., Bhardwaj, Minakshi, Maekawa, Fumi, and Niimura, Yuki, "Ethical opportunities in global agriculture, fisheries, and forestry: The role for FAO," Journal of Agricultural and Environmental Ethics 16(2003):479-504. FAO (Food and Agriculture Organization) has a unique and essential role in addressing the ethical problems facing humanity and in making these problems into opportunities for practical resolution. A broad range of ethical issues in agriculture, fisheries, and forestry were identified by analysis of the literature and by interviews with FAO staff. Issues include sharing access to and preserving natural resources, introduction of new technology, conservatism over the use of genetic engineering, ethics in animal agriculture, access to information, food security, sustainable rural development, ensuring participation of all people in decision making and in receiving benefits of agriculture, reducing corruption, and involvement of private and public sectors in decision making. Rather than viewing these issues as problems, they should be viewed as opportunities for debate, learning about others' views, and resolution. The United Nations has an important role to play in how decisions are made in the global ethical debate in food and agriculture. KEY WORDS: agriculture FAO, biotechnology, environment, ethics, fisheries, United Nations. (JAEE)

Macer, Darryl, "Uncertainties About 'Painless' Animals", Bioethics, 3 (1989): 226-35. Genetic techniques are being increasingly employed to alter animals used in both medical and agricultural research, and will no doubt be extended into many applications. This paper seeks to examine whether it is possible to genetically manipulate animals so that they have an altered capacity to feel pain; whether it would be ethical to do so; and how we would regard animals that do not feel pain. The creation of "painless" animals in order to make a new class of means for human ends may alter the way we argue about the use of animals. Instead of animals possessing some sort of integrity, they can be made the longterm property of humans, not only in commercial terms, or when or how they come into existence, but in whether they are sentient animals of a new class of "painless" animals. Some would argue that this new class would possess the moral status of plants, however, many would share the author's view that this would be an unethical use of our power over nature. The difficulty is to say precisely why it is unethical.

Macer, Darryl R. J., Bioethics Is Love of Life: An Alternative Textbook. Christchurch, New Zealand: Eubios Ethics Institute, 1998. 160 pages. ISBN 0-908897-13-8. Bioethics interpreted as the love of life. "Love of life" is the simplest and most all encompassing definition of bioethics, and it is universal among all peoples of the world" (p. 1). Chapter 7 is "Love of Nature and Environmental Ethics." Environmental ethics as love of life, biophilia, loving especially the integrity of life, organismic and holist. An alternative view published in a location that might not otherwise come to your attention. Macer is a New Zealander who has spent many years teaching at the University of Tsukuba, Tsukuba, Japan, and has also been instrumental in promoting bioethics in India. Macer, Darryl, "Animal Consciousness and Ethics in Asia and the Pacific," Journal of Agricultural and Environmental Ethics 10(1997/1998):249-267. ABSTRACT. The interactions between humans, animals and the environment have shaped human values and ethics, not only the genes that we are made of. The animal rights movement challenges human beings to reconsider interactions between humans and other animals, and may be connected to the environmental movement that begs us to recognize the fact that there are symbiotic relationships between humans and all other organisms. The first part of this paper looks at types of bioethics, the implications of autonomy and the value of being alive. Then the level of consciousness of these relationships are explored in survey results from Asia and the Pacific, especially in the 1993 International Bioethics Survey conducted in Australia, Hong Kong, India, Israel, Japan, New Zealand, The Philippines, Russia, Singapore and Thailand. Very few mentioned animal consciousness in the survey, but there were more biocentric comments in Australia and Japan; and more comments with the idea of harmony including humans in Thailand. Comparisons between questions and surveys will also be made, in an attempt to describe what people imagine animal consciousness to be, and whether this relates to human ethics of the relationships. KEY WORDS: Animals, Asia, consciousness, Australia, Hong Kong, India, Israel, Japan, New Zealand, The Philippines, Russia, Singapore, Thailand. (JAEE)

MacGregor, Sherilyn, "From Care to Citizenship: Calling Ecofeminism Back to Politics," Ethics and the Environment 9(no. 1, 2004):56-84. Although there are important aspects of ecofeminist valuations of women's caring, a greater degree of skepticism than is now found in ecofeminist scholarship is in order. In this article I argue that there are political risks in celebrating women's association with caring, as both an ethic and a practice, and in reducing women's ethico-political life to care. I support this position by drawing on the work of feminist theorists who argue that the positive identification of women with caring ought to be treated cautiously for it obscures some of the negative implications of feminized care and narrows our understanding of women as political actors. I explain why I think ecofeminists would be better served by using feminist theories of citizenship to understand and interpret women's engagement in politics. MacGregor is in the Institute for Environment, Philosophy, and Public Policy at Lancaster University, UK. (E&E)

Machan, Tibor R., Putting Humans First: Why We Are Nature's Favorite. Lanham, MD: Rowman and Littlefield, 2004. The primacy of human life in the natural world and the corresponding justice of humans making use of animals. Disputes the concept of "animal rights" and "animal liberation." Humans are very much a part of nature though not, ordinarily, of the wild. Given their nature, human beings not only can, but ought to use nature to serve their needs. Machan is emeritus in philosophy, Auburn University,

and currently teaching at Chapman University.

Machan, Tibor R., "Do Animals Have Rights?" Public Affairs Quarterly 5(April 1991): 163-173. "Animals have no rights and need no liberation. To think that they do is a category mistake." "Rights and liberty are political concepts applicable to human beings because human beings are moral agents." "There is a scale of importance in nature, and among all the various kinds of being, human beings are the most important..." "With human nature a problem arose in nature that had not been there before--basic choices had to be confronted, which other animals do not have to confront. The question, 'How should I live?' faces each human being. ... For this reason we are very different from other animals--we also do terrible, horrible, awful things to each other as well as to nature, but we can also do much, much better and achieve incredible feats nothing else in nature can come close to." "There is plainly no valid intellectual place for rights in the non-human world, the world in which moral responsibility is for all practical purposes absent." "Animals are not the sort of beings with basic rights to life, liberty and property, whereas human beings, in the main, are just such beings. Yet we know that animals can feel pain and can enjoy themselves and this must give us pause when we consider using them for our legitimate purposes. We ought to be humane, we ought to kill them and rear them and train them and hunt them in a fashion consistent with such care about them as sentient beings." Machan is in the Department of Philosophy at Auburn University. (v2,#2)

MacIntyre, Alasdair, Dependent Rational Animals. Chicago: Open Court, 2000. Dependency and vulnerability are the keys unlocking the secrets of human morality. All humans are dependent throughout life, from infancy to age. A community's care for its dependents is a fundamental measure of its moral stature. Other animals experience extended dependence, such as dolphins and gorillas, and they too exhibit the elementary moral characteristics of cooperation, mutual protection and care for the disabled. Becoming morally mature is a matter of becoming an "independent practical reasoner," (rather than a matter of psychological health, self-actualizing, identity, etc.). In mature morality we learn how to reflect both on our needs and the communal practices that meet our dependencies. We learn how to evaluate these needs, something the higher animals never master, and to adjust them in terms of the needs of others. The virtues--such as "just generosity"--are important because they sustain independent practical reasoning. (v.11,#3)

Macnaghten, Phil and Urry, John, Contested Natures. London and Thousand Oaks, CA: Sage Publications, 1998. \$ 26.50 paper. \$ 82.00 cloth. There is no singular "nature" out there that is the fountainhead of pure and positive values waiting to be saved. Rather, there are multiple "natures." Nature is constantly changing its significance in daily life. Nature is irreducibly contested and embedded in highly diverse and ambivalent social practices. All notions of nature are bound up with different forms of social life from which they cannot be disentangled. The apparently natural world has been produced in many ways within particular social practices. Different times, different senses, produce different and distinct spaces, from the local to the global. The authors are at Lancaster University, UK. (v.9,#3)

Macnaghten, Phil and Urry, John, Contested Natures. London: Sage, 1998. "In this book we seek to show that there is no singular 'nature' as such, only a diversity of contested natures; and that each such nature is constituted through a variety of socio-cultural processes from which such natures cannot be plausibly separated. We therefore argue against three doctrines which are widespread in current thinking about nature and the environment. ...

The first, and most important for our subsequent argument, is the claim that the environment is essentially a 'real entity', which, in and of itself and substantially separate from social practices and human experience, has the power to produce unambiguous, observable and rectifiable outcomes. This doctrine will be termed that of 'environmental realism', one aspect of which is the way that the very notion of nature has been turned into a scientifically researchable environment. ...

The second doctrine is that of 'environmental idealism'. ... This doctrine holds that the way to analyze nature and the environment is through identifying, critiquing and realising various 'values' which underpin or relate to the character, sense and quality of nature. ...

The third doctrine specifically concerns the responses of individuals and groups to nature and the environment. It is concerned to explain appropriate human motivation to engage in environmentally sustainable practices and hence the resulting environmental goods or bads. ... This doctrine we will term 'environmental instrumentalism' and is importantly linked to a marketed naturalistic model of human behavior, and its radical separation from non-human species" (pp. 1-1). "The 'social' dimensions of nature have been significantly under-examined" (p. 4).

MacPhee, Ross D. W., ed., Extinctions in Near Time: Causes, Contexts, and Consequences. New York: Kluwer Academic/Plenum Publishers, 1999. Extinctions during the time Homo sapiens has been on Earth, the last 100,000 years or so. There have been many losses when people began to expand across areas that had never before experienced their presence. Human effects have been especially disruptive on islands, and the contributors think the human presence on continents has often been almost as bad, although climate change complicates the evidence, and fewer animals disappear where humans had longer been, Europe and Africa. Debate continues and many issues are unresolved. In the last 500 years, three-quarters of all mammal extinctions occur on islands, and most of the remainder occur in Australia. Most of the recent mammal extinctions are small mammals, in contrast with the Pleistocene extinctions, where most were large (though this may reflect bias in fossil preservation). (v.13,#1)

MacRae, R.J., Henning, J., and Hill, S.B., "Strategies to Overcome Barriers to the Development of Sustainable Agriculture in Canada: The Role of Agribusiness", Journal of Agricultural and Environmental Ethics 6(1993):21-52. Strategies to involve agribusiness in the development of sustainable agricultural systems have been limited by the lack of a comprehensive conceptual framework for identifying the most

critical supportive policies, programs and regulations. In this paper, we propose an efficiency/substitution/redesign framework to categorize strategies for modifying agribusiness practices. This framework is then used to identify a diverse range of short, medium, and long-term strategies to be pursued by governments, community groups, academics and agribusiness to support the transition. Strategies discussed include corporate greening, ethical investment, changing the legal status of the corporation, new business forms and the development of ecological economics. MacRae, Henning, and Hill are at Macdonald College of McGill University, Quebec.

Maddock, Ant H. and Michael J. Samways. "Planning for Biodiversity Conservation Based on the Knowledge of Biologists," Biodiversity and Conservation 9(no. 8, 2000):1153-1169. Abstract. To conserve biodiversity, complementary approaches are necessary. Besides using museum data from sightings and specimens, the knowledge of experts can also be employed. Often such valuable information is lost on retirement or death. To investigate the value of this knowledge for nature conservation planning, we sent questionnaires to 124 professional conservationists in the province of KwaZulu-Natal, South Africa. Fifty-two replies illustrated that the historical context biases our concepts of nature and the conservation of biodiversity. Despite an awareness of all the spatial scales, complexities and dynamics of nature, there is still a strong focus on large-sized animals and visibly discrete ecosystems, such as wetlands. Nevertheless, the respondents illustrated that an awareness of infrequently-seen and less well known organisms is increasing. Harnessing this expert knowledge was valuable for conservation planning, but had the weakness that many taxa and localities were neglected. Similar problems arose with data from museum specimens. However, both these approaches were synergistic and highlighted the geographical areas that need far more exploration of their biodiversity. Such information gathering is an important ethical and practical exercise for conserving biodiversity. Key words: biodiversity, concepts, conservation, nature, planning, questionnaire survey.

However, both these approaches were synergistic and highlighted the geographical areas that need far more exploration of their biodiversity. Such information gathering is an important ethical and practical exercise for conserving biodiversity. Key words: biodiversity, concepts, conservation, nature, planning, questionnaire survey. Samways is at the Invertebrate Conservation Research Centre, School of Botany and Zoology, University of Natal, Pietermaritzburg, South Africa. (v.13,#1)

Madigan, Nick, "Hearst Land Settlement Leaves Bitter Feelings: Deal Will Limit Public Access to Coast," New York Times, September 20, 2004, page A13. A complex conservation deal in coastal California, San Luis Obispo County, involves State of California purchase of much of the giant holdings of the Hearst Corporation, largely undeveloped and owned by descendants of the publishing magnate William Randolph Hearst. The dispute has involved finding a middle ground between the interest of the public, which is entitled by law to access to the beach, and that of the Hearst Corporation which controls vast tracts of land from which it has the right to profit. Opponents of the deal say the State is too generous to the Hearst Corporation, which has retained the most dramatic parts of the coastline and plans to develop luxury homes on 320 acre parcels and a large hotel, "the most exclusive subdivision on the West Coast." Public use of the beaches is limited to 100 persons a day during daylight hours in one of the two most scenic areas and to 20 people at a time once a month in the other. (v.14, #4)

Madigan, Nick, "Enlisting Law Schools in Campaign for Animals," New York Times, November 27, 2004, p. A1, A 23. Bob Barker, long-time host of "The Price Is Right," has given a million dollars to each of several law schools to set up law education in animal welfare legislation, including those at Stanford, Columbia, Duke, the University of California, Los Angeles, and Harvard. An additional concern is having pet animals spayed. (v.14, #4)

Madsen, Kathrine Hauge, Holm, Preben Bach, Lassen, Jesper and Sandøe, Peter, "Ranking Genetically Modified Plants According to Familiarity," Journal of Agricultural and Environmental Ethics 15(no. 3, 2002):267-278. In public debate GMPs are often referred to as being unnatural or a violation of nature. Some people have serious moral concerns about departures from what is natural. Others are concerned about potential risks to the environment arising from the combination of hereditary material moving across natural boundaries and the limits of scientific foresight of long-term consequences. To address some of these concerns we propose that an additional element in risk assessment based on the concept of familiarity should be introduced. The objective is to facilitate transparency about uncertainties inherent in the risk assessment of the GMP. Familiarity conventionally involves data and experience relating to the plant species and the ecosystem in question. We would like to extend this concept to the molecular level of plant breeding and suggest that GMP characteristics should be compared to a reference baseline determined by conventional breeding techniques. Three GMPs are ranked according to familiarity at the plant and ecosystem level and the molecular level. The approach may help to integrate discussion of the scientific arguments and moral questions raised in the debate about GMOs by providing an operational scheme within which moral concerns are brought within the framework of science-based risk assessment. KEY WORDS: bioethics, familiarity, regulation, risk assessment, unnatural. Madsen, Lassen, and Sandøe are with the Centre for Bioethics and Risk Assessment, The Royal Veterinary and Agricultural University, Frederiksberg, Denmark. Holm is with the Danish Institute of Agricultural Sciences, Research Centre, Flakkebjerg, Denmark. (JAEE)

Maestas, Jeremy D., Knight, Richard L., and Gilgert, Wendell C., "Biodiversity across a Rural Land-Use Gradient," Conservation Biology 17 (No. 5, October 2003):1425-1434. Biodiversity compared in ex-urbia, ranchlands, and nature reserves. Some bird species that adjust well to humans (with bird feeders or garbage piles) may be increased in numbers in ex-urbia, but most are not. Wildlife are on ranchlands and reserves, but, surprisingly, there may be fewer invasive exotics on ranchlands than on nature reserves--possibly because nature reserves have trails with lots of people on them, who bring in the seeds. In the face of expanding ex-urbia and limited nature reserves, the authors conclude that attention to biodiversity conservation on ranchlands is quite vital. Maestas is with the U.S. Natural Resources Conservation Service, Provo, Utah. (v.14, #4)

Magnuson, Jon, "Reflections of an Oregon Bow Hunter," Christian Century, March 13, 1991. The Lutheran campus pastor at the University of Washington in Seattle goes bow hunting for elk with one of the Pacific Northwest's most respected trophy bow hunters, also a churchman. Magnuson fears that "as populations become increasingly urbanized and technologically sterile, natural cycles of decay, death and

rebirth become dangerously romanticized and more remote from realities of daily life." He worries that antihunting protests have "triggered more guilt than I'd like to admit." His guide urges "the need to recognize the natural world for its own values and laws. He is a committed bow hunter because it draws him into a relationship and harmony with the natural world. You have to learn to respect the animal you hunt." After three days of immersion in the Oregon wilds, Magnuson gets a short. "I am poised with the decision whether or not to loose the arrow. A prayer now on my lips. My fingers release" "to identify myself with an ancient primordial ritual, the spilling of blood." (v2,#1)

Magnuson, Jon, "Great Lakes, Troubled Waters," Christian Century 116(no. 25, Sept. 22-29, 1999):902-905. The Great Lakes basin, populated by over 40 million people, is at the center of a collision of economic interests and environmental politics. Authorities are reluctantly acknowledging that the lakes have been polluted by economic interests, to the point of jeopardizing human health. "It's not the water of the Great Lakes we finally have to worry about. It is ourselves." Magnuson, a Lutheran pastor, is a member of the Lake Superior Binational Forum, of the International Joint Commission of Canada and the United States. (v.10,#3)

The American myths and late-Victorian values behind the movement both to preserve the Yellowstone wilderness and to extract its natural resources, codifying the ultimate American landscape. (v10,#4)

Magretta, Joan, "Growth Through Global Sustainability: An Interview tih Monsanto's CEO, Robert B. Shapiro," Harvard Business Review 75(no. 1, Jan./Feb. 1997):79-88. Shapiro claims: The need for environmentally sustainable products will soon create a major strategic discontinuity for the world's enterprises. Recognition of this discontinuity is transforming Monsanto's thinking about growth. Although a closed suestem like the earth cannot support an unlimited increase of material things, it can withstand exponential growth of information. Hence two design principles have been incorporated into new product development at Monsanto: substituting information for "stuff" and replacing products with services. (v8,#1)

Maguire, Daniel C. and Rasmussen, Larry L., Ethics for a Small Planet. Albany, NY: SUNY Press, 1998. The crisis caused by the combined impact of overpopulation, overconsumption, and economic and political injustice. The authors wish to bring religious scholarship into dialogue with the world's policymakers. The world's religions will be important players in the crises relating to population and the threat of ecocide. Maguire indicts our male-dominated religions for the problems they have caused for our ecology and reproductive ethics. Rasmussen claims that Europeans packaged a form of earth-unfriendly capitalism and shipped it all over the world with missionary zeal. Maguire teaches social ethics at Marquette University. Rasmussen teaches social ethics at Union Theological Seminary, New York. (v9,#1)

This is a response to Val Plumwood's critique of Plato and an overview of the way in which Plato provides a viable environmental vision. This vision sees the realm of nature as rooted in the realm of logos, and human beings as sojourners who are nonetheless integral parts of nature whose vocation is to act as mediators between the realms thereby bringing nature into even greater participation in logos. To fulfill the human vocation one must come to an awareness of the logos by purging oneself of the sham values which permeate society and distort one's understanding of reality. Mahoney is in philosophy at the University of Texas at Arlington. (E&E)

Malakoff, David, and Stone, Richard, "Scientists Recommend Ban on North Sea Cod," Science 298(1 November 2002):939. Cod stocks in the northeast Atlantic are at historic lows, and a panel of scientists says that populations will collapse if there are not drastic reductions in fishing. But this could cost 20,000 jobs in the United Kingdom alone. It looks like it is doomsday either for the cod or for the cod fishermen. (v.13,#4)

Malakoff, David, "Congress Clears Way for Rodent Rules," Science 294(23 November 2001):1637. Animal welfare of rodents. For thirty years, the United States Department of Agriculture (USDA) has exempted mice, rats, and birds from the Animal Welfare Act. But these account for 95% of all experimental animals. The U.S. Congress has approved the start of developing rules for the use of rodents, previously blocked by biomedical research groups. The USDA has been persistently sued by animal rights groups and had agreed to draft caging and care rules. But biomedical groups had blocked this until now. Depending on how fast the USDA moves, the matter could soon be back in court. (v.13,#1)

Malakoff, David, "Plan to Import Exotic Beetle Drives Some Scientists Wild," Science 284(1999):1255. Endangered flycatcher, exotic beetle, and invasive tamarisk. Tamarisk, or saltcedar, was introduced years ago as a windbreak and to control erosion in the U.S. West and has proved an disastrous invasive, displacing riverine native plants in fifteen states. Tamarisk flourishes in the highly modified rivers that agriculture, damming, irrigation, and overgrazing in the West has created. Plans to import an exotic beetle that feeds on the tamarisk, however, have been limited because, meanwhile, the endangered willow flycatcher, deprived of its original nesting habitat, has learned to nest in the tamarisk. But the U.S. Fish and Wildlife Service, charged with both uprooting the tamarisk and preserving the flycatcher, is making limited trials of beetle introductions. (v.10,#2)

Malakoff, David, "Plan to Import Exotic Beetle Drives Some Scientists Wild," Science 284(12 May 1999):1255. Endangered species living in exotic pest. Saltcedar (Tamarix) was introduced extensively in the last century as a windbreak and to control erosion in the U. S. Western states, and has proved an ecological disaster, covering 500,000 hectares in 15 states, and crowding out native vegetation in riparian areas. A plan to use an introduced Chinese leaf beetle to control it seems promising; but, alas, the endangered willow flycatcher has learned to nest in the saltcedar. The plan has been put on hold, and subject to more extensive (and more carefully controlled) testing. (v10,#4)

Malakoff, David, "Researchers Fight Plan to Regulate Mice, Birds," Science 290(6 October 2000):23-24, also "Research Group Wins Delay in Rules," Science 290(13 October 2000):243-245. Also: McArdle,

John, "Animal Welfare Act's Changes Deserve Praise, Not Panic," Science 290(17 November 2000):1299-1300. Are mice animals? No. Yes. No, at least not in 2001. The U.S. Department of Agriculture agreed to a lawsuit settlement challenging the 30-year old ruling that mice, rats, and birds are not laboratory "animals," under the Animal Welfare Act. This exempted 95% of all experimental animals from the federal government's legal definition of "animal." Animal welfare advocates have long challenged the ruling. In 1992 a federal judge ruled that the USDA's justification for the exemption--that Congress never intended the law to apply to the three kinds of animals-- was "strained and unlikely." In September 2000, the USDA agreed to include these animals and "initiate and complete a rulemaking on the regulation of birds, rats, and mice within a reasonable time."

Biomedical research groups protested vigorously, though their protests were disregarded by the USDA and the courts. But through the request of the University of Mississippi Medical Center in Jackson to Congressman Thad Cochran (R-MS), on a rider attached to the agriculture appropriations bill, Congress voted that mice, rats, and birds will not be animals in fiscal year 2001. A recent editorial in Nature complained, "Some of the research lobby's arguments verge on the reactionary." Although currently voluntary, many research laboratory animals have included these animals in animal welfare concerns for decades. Others claim it will drive up costs unacceptably. (v.11,#4)

Malakoff, David, "Arizona Ecologist Puts Stamp on Forest Restoration Debate," Science 297(27 September 2002):2194-2196. Wally Covington, forest ecologist at Northern Arizona State University, wants to return ponderosa pine forests to their "presettlement" state, but argues that managed burning is not enough; present forests, laden with fuel from too much suppression, need to be heavily cut, as well as burned. Loggers and President Bush find this a desirable forest policy, since they can both cut and prevent fires. They keep Covington well funded. But other environmentalists are not so sure, even about the ponderosa pines in Arizona, and are quite sure that one ought not to extrapolate a "one size fits all" to policy for other kinds of forests. Summer fires in 2002 in the West have heated up this debate. (v.13,#4)

Maler, Karl-Goran, "Economic Growth and the Environment," Encyclopedia of Biodiversity 2: 277-284. Will economic growth deteriorate or improve the environment? The general finding for many pollutants is that a country with a very low income does not have much pollution but when the scale of the economy grows, for example, as measured by GDP per capita, emissions of these pollutants will increase. However, when the income per capita is high enough, the economy will reach a turning point and pollution will decrease with further increases in per capita income. However, empirical and conceptual challenges remain. (v.11,#4)

Mallory, Chaone. "Ecofeminism and Forest Defense in Cascadia: Gender, Theory, and Radical Activism." *Capitalism, Nature, Socialism* Vol. 17, no. 1 (2006): 32-49. The article focuses on the nature of ecofeminism and its actions for the protection of forests in Western U.S. and Canada. The continued increase of forest protection movements are organized mainly by women. It must also be emphasized that local environmental struggles always take place in a global context, which always include the historical movements and intrigues of capitalism, the physical and cultural variability of the ecological region. A feminist perspective is relevant to understanding the global environmental crisis. Ecofeminism contains a constructive, prefigurative vision that attempts to transform existing power relations both intra and trans-human in ecologically sound and socially just actions. In 2006 Mallory accepted a position as Assistant Professor of Environmental Philosophy at Villanova University. She completed her doctoral degree in Environmental Science, Studies, and Policy from the University of Oregon after successfully defending her dissertation on the topic of developing ecofeminist models and methods of political and legal representation for and with the more-than-human world.

Maltby, Paul, "Fundamentalist Dominion, Postmodern Ecology," *Ethics and the Environment* 13(no. 2, 2008):119-141. Christian fundamentalist dominionism is susceptible to a conventional ecological critique; that is to say, one framed in scientific-environmentalist terms of its unsustainability as a practice, given nature's finite resources and the fragility of ecosystems. Alternatively, a postmodern ecological critique has the conceptual tools to contest dominionism at the level of its *discursive* transactions, that is to say, the narrative frames and interpretive methods through which fundamentalists have constructed their understanding of the natural world. I shall suggest how postmodernism enables critical standpoints which, collectively, open a second front in an engagement with the dominionist model of humanity's relationship to nature. Paul Maltby is Professor of English at West Chester University.

Mandiberg, Susan F., "The Dilemma of Mental State in Federal Regulatory Crimes: The Environmental Example", Environmental Law, 25(No.4, 1995):1165- . Mandiberg draws upon Supreme Court case law and traditional common-law principles to suggest a framework for interpreting the mental state provisions of environmental and other regulatory crimes. Unlike other commentators, she suggests that mental-state analysis be grounded in notions of moral wrongdoing, understood from a modern perspective. Professor Mandiberg then applies this framework to the Resource Conservation and Recovery Act, the Clean Water Act, and the Migratory Bird Treaty Act to resolve some outstanding issues and illuminate others that have not yet been widely addressed by the courts. (v7,#1)

Manes, Christopher, Green Rage: Environmentalism and the Unmaking of Civilization. New York: Little, Brown. 291 pages. \$ 18.95. Manes, once a Fulbright scholar and early associate editor of Earth First!, wrote Green Rage during his first year of law school at the University of California at Berkeley. He chronicles the historical events, political context, and social impetus that created the radical environmentalist groups, such as Greenpeace and Earth First! Radical environmentalism may be the last chance for turning away from destroying the planet to cohabiting the planet with other life forms. Green Rage is already a best-seller on the West Coast. (v1,#4)

Manes, Christopher, "Philosophy and the Environmental Task," Environmental Ethics 10(1988):75-82. Manes argues that environmental ethics is a "negative ethics" that offers the task of resistance to the totalizing metaphysics of technology. As a philosophy, environmental ethics must be concerned with action, not philosophical dialectics, logic, or theology. Solid argument by a non-academic philosopher. (Katz, Bibl # 2)

Manes, Christopher. "Philosophy and the Environmental Task." Environmental Ethics 10(1988):75-82. Although the particular ethical consequences of biocentrism can be defended at a logical level, the centrality of problems with valuational frameworks in biocentric ethics leads to ontological ambiguities which contribute to the broader problematic of modern metaphysics. I suggest, however, that this may actually help to thematize the relationship between the metaphysical foundations of environmentalism and its social task. Mysticism and phenomenology, including the concept of the "ecological self," attempt to settle these ambiguities in a dialectical opposition to the technological world view behind the environmental crisis. Whatever ontological stability they achieve, however is at the expense of being assimilated by the same kind of metaphysical totalization characterizing technological thinking. Unlike anthropocentrism and the stewardship model of environmentalism, nevertheless, these difficulties for biocentrism lead to positive results: the ambiguities in the search for philosophic stability and foundational certainty can act as a cue to the nonmetaphysical task of analyzing and resisting technological power. The result may be a "negative ethics," but one that holds out the possibility of confronting the real power relations of technological culture (and the use of ethics within them), rather than pursuing the endless project of discovering the hidden source of value and meaning. Manes is a graduate student in Old English Literature and Medieval Studies at the University of Oregon. (EE)

Manes, Christopher. "Contact and the Solid Earth," Wild Earth 7(no.1, 1997):19. (v8,#2)

Manes, Christopher. "Nature and Silence." Environmental Ethics 14(1992):339-50. A viable environmental ethics must confront "the silence of nature"--the fact that in our culture only humans have status as speaking subjects. Deep ecology has attempted to do so by challenging the idiom of humanism that has silenced the natural world. This approach has been criticized by those who wish to rescue the discourse of reason in environmental ethics. I give a genealogy of nature's silence to show how various motifs of medieval and Renaissance origins have worked together historically to create the fiction of "Man," a character portrayed as sole subject, speaker, and telos of the world. I conclude that the discourse of reason, as a guide to social practice, is implicated in this fiction and, therefore, cannot break the silence of nature. Instead, environmental ethics must learn a language that leaps away from the motifs of humanism, perhaps by drawing on the discourse of ontological humility found in primal cultures, postmodern philosophy, and medieval contemplative tradition. Manes is a graduate student in Old English Literature and Medieval Studies at the University of Oregon. (EE)

Mangel, M. et al., "An Interdisciplinary Examination of Carnivore Reintroductions." In J. L. Gittleman, Carnivore Behavior, Ecology, and Evolution, pp. 296-336. Ithaca, NY: Cornell University Press, 1996. (v8,#1)

Mangels, Ann Reed, "Vegan Diets for Women, Infants, and Children", Journal of Agricultural and Environmental Ethics 7(1994):111-122. Infants, children, adolescents, and pregnant and lactating women have been described as groups with special needs and at higher risk for nutritional deficiencies than adult males. Vegan diets can be safely used by these groups if foods and in some cases supplements are selected with provide a healthful and nutritionally adequate diet. There is a c=scarcity of studies of "newer" vegetarians who are often more mainstream than the vegetarians of the 1960's and 1970's. In some instances this has led to assumptions about today's vegans which are based on out-dated information. Thorough scientific new studies are needed. Mangels and Havalala are nutrition advisors at the Vegetarian Resource Group, Baltimore, MD.

Mann, Bonnie, "World Alienation in Feminist Thought: The Sublime Epistemology of Emphatic Anti-Essentialism," Ethics and the Environment 10(no. 2, 2005):45-74. The alliance between feminism and postmodernism in the American academy has brought about a revolution in feminist epistemology. Many feminists have taken on the epistemology of the simulacrum. Here "the real" plays a part only as that which dissolves into the appearances themselves. Behind the appearances, if there were such a place, would be only an abyss of absence. With this revolution in feminist epistemology comes a wholesale displacement of the feminist project. The ultimate price we pay for the feminist alliance with

postmodernism may well be a material displacement, in which we are dispossessed of our ability to inquire into and articulate our relationship to the earth itself. We find this planet we inhabit, this physical place that sustains us moment by moment, to be effectively shut out of what now passes as "good" feminist thought. Mann is in philosophy, University of Oregon, Eugene, (Eth&Env)

Mann, Charles C., and Plummer, Mark L., "Army Corps Siezed by Dam Indecison," Science 287 (7 January 2000):27. The U.S. Army Corps of Engineers pleads for more time to decide whether to remove four dams on the Snake River to save endangered salmon in the Pacific Northwest. The Corps finds that there would be great benefits to wildlife, but heavy economic and social impacts. Critics say that ample data is already in and that the Corps is stalling. (v10,#4)

Mann, Charles, "How Many is Too Many?" Atlantic Monthly, February 1993. The answers to this question since the 1700's have varied between those who believe that continued population growth will eventually lead to an environmental catastrophe (such as economist Robert Malthus in 1798 and the biologist Paul Ehrlich in his 1968 book The Population Bomb) and those who argue that increasing technological efficiency and changing social/economic patterns will solve the problem (such as the Marquis de Condorcet in 1794 or A. B. and L. H. Louvins in their 1991 essay "Least Cost Climatic Stabilization"). At the Rio Earth Summit the developing countries of the South responded to the developed countries of the North saying that the problem is not one of overpopulation in the South but of excessive consumption in the North. This ignores the increasing numbers of well-off people in developing countries who consume at the same unsustainable level as those in developed countries. India, for example, has between 150-300 million rather wealthy consumers. (v8,#3)

Mann, Charles C., and Mark L. Plummer. Noah's Choice: The Future of Endangered Species. New York: Knopf, 1995. 302 pp. \$24. ". . . an excellent review of the goals and workings of the law, . . . presents what likely will continue to be an unavoidable clash among society's fundamental values"--Brad Knickerbocker, The Christian Science Monitor, 14 March 1995, p. 11. (v6,#1)

Mann, Charles C., *1491: New Revelations of the Americas*. New York: Knopf, 2005. Mann traces new revelations about the native Americans before Columbus, in North, Central, and South America, with the general aim of shooting down previous misconceptions about Indian ignorance and simplicity, also myths about the white man's superiority. Dean R. Snow, anthropology, Pennsylvania State University, gives the book a quite mixed review in "Picturing the Pre-Columbian Americas," Science 312 (2 June 2006): 1313, finding the book a good read but erratic and sometimes mistaken.

Mann, Charles C. and Mark Plummer. "Is Endangered Species Act in Danger?" Science 267 (March 3, 1995): 1256-1258. The Act needs to be reauthorized, and refunded, this year. Far more plants and animals are being added to the list than are leaving it. Critics say that act is as fault; supporters say the budget for enforcement is far too small. Critics say few species are being recovered; supporters say that you should not expect high recovery rates in an intensive care emergency room. A frequent theme is rather pragmatic: since the Act isn't working, and can't be made to work because it is too expensive and landowners won't cooperate, maybe we should do something else. Mann and Plummer are co-authors of Noah's Choice: The Future of Endangered Species. Couple any reading of this with the review by Gary Paul Nabhan in Orion, Spring 1995, pp. 60-61: "Noah's Choice is a highly engaging and challenging but ultimately disappointing polemic on why endangered species conservation efforts are based on unsubstantiated scientific claims that do not sufficiently yield to human concerns. Although the authors are respected journalists ..., they suffer from a chronic inability to deal with a trait inherent to modern science: uncertainty." (v6,#1)

Mann, Charles C., "Extinction: Are Ecologists Crying Wolf?" Science, August 16, 1991, Critics say the mega-extinction predictions are exaggerated. Part of the trouble is whether the theory of island

biogeography is applicable to tropical forests; part of the trouble is general ignorance about what is there, especially with insects and fungi, part of the trouble is how species are related to ecosystems, and how much human interference upsets systems outside the temperate zone. (v2,#3)

Mann, Charles C., "The Real Dirt on Rainforest Fertility," Science 297(9 August 2002):920-923. Most Amazonian rainforest has poor soil; the nutrients are in the forests above the surface. But there is a soil named terra preta, prized for its great productivity. Archaeologists now believe these soils, often in 1-5 hectare plots, were created by ancient Amazonians through some agricultural practices at which we can mostly only speculate. Some argue for a modified slash and burn called "slash and char," but others claim the ancients had no way to cut down large numbers of trees. There are research efforts to create similar soils, in the hope of greater Amazonian fertility. Still others lament that the rainforest will be destroyed anyway, whether for poorer or richer soils. (v.13, #3)

Mann, Charles C. and Mark L. Plummer, "The Butterfly Problem," Atlantic Monthly, January 1992. Grounded in "the Noah principle"--the view shared by many conservationists that all species have a right to exist--the Endangered Species Act insists that we attempt to save every threatened species. This inflexibility has now become economically untenable. Because the government does not have the means to preserve endangered species, let alone a coherent plan, its decisions are haphazard. Private landowners often find themselves paying for the preservation of species they never heard of. (v3,#1)

Mann, Charles C. and Plummer, Mark L., "Forest Biotech Edges Out of the Lab," Science 295(1 March 2002):1626-1629. Transgenic forestry? Frankentrees? New, high-intensity tree plantations are setting the stage for rapid biotechnological change in forestry. But the novel methods may never be used if the ecological risks and economic obstacles cannot be overcome. In a test plantation in drylands Oregon, 7200 hectares of cloned hybrid poplars, planted in square blocks 400 meters to a side, receive water, fertilizer, and pest treatments under a computer-controlled system, and are growing at ten times the usual rate for poplars. But ecologists and others worry what if the genes from these huge mechanized plantations spread into the wild?(v.13, #3)

Mann, Charles C., "Unnatural Abundance," New York Times, November 25, 2004, an op-ed piece. Mann de-bunks the first Thanksgiving and its myth of abundance on the American landscape. Most of the productivity and many invasives were introduced either by the Europeans or were present by virtue of Indian management of the landscape, which kept the Eastern forests game-friendly, although the Indians had just been decimated before the Pilgrims arrived by a viral disease caught from shipwrecked French sailors. Mann even thinks the buffalo herds were managed by the Indians (without horses), and that the huge herds the Europeans encountered were a result of the lack of Indian control, since the virus had decimated them. The Indians likewise managed the huge flocks of passenger pigeons. (v.14, #4)

Mann, Charles C., and Mark L. Plummer, Noah's Choice: The Future of Endangered Species. New York: Alfred A. Knopf, 1995. 302 pages. \$24. (v6,#2)

Mann, Charles C. "America, Found and Lost." National Geographic Vol. 211, no. 5 (May 2007): 32-67. "Jamestown: the real story: how settlers destroyed a native empire and changed the landscape from the ground up. How the English unsettled the landscape. Far from a pristine wilderness, the land inhabited by the Powhatan Indians was carefully managed. They burned undergrowth to keep the forest open, relocated their villages when crop depleted soils, and ranged widely to fish, hunt, and gather all they needed, moving with the seasons" (p. 46).

Mann, Stefan, "Different Perspectives on Cross-Compliance," Environmental Values 14(2005): 471-482. Cross-compliance has proven its effectiveness, as can be shown by looking at the Swiss experience with cross-compliance since 1999. Besides describing the existing cross-compliance practices in Switzerland, the paper shows different perspectives on the efficiency and fairness of cross-compliance. It concludes that transaction cost advantages justify cross-compliance only in few cases. Usually, it will be more efficient to decouple social and environmental policy. The strong support for cross-compliance by the Swiss population is explained by a perceived unfairness in the distribution of property rights between farmers and society. If property rights would be redistributed, there probably would be no more need for cross-compliance. Mann is at the Federal Research Station for Agricultural Economics and Engineering, Ettenhausen, Switzerland. (EV)

Mann, Stefan, "Ethological farm programs and the market for animal welfare," Journal of Agricultural and Environmental Ethics 18(2005):369-382. Ethological farm programs in Switzerland are compared with environmental farm programs. Animal welfare is not a public good, and so the demand for animal welfare has a different standing in economic theory than the demand for a clean environment. The supply of animal welfare by farmers, however, largely follows the patterns known from the delivery of environmental goods. The design of ethological farm programs should be based on broad public discussions as described by deliberation theorists rather than willingness-to-pay studies. (JAEE)

Both wilderness values and environmental ethics can be isolated and measured and are significantly related to wilderness purity. Manning teaches in natural resources at the University of Vermont, Valliere is a research assistant there. (v7, #3)

Manning, Russ. "Environmental Ethics and Rawls' Theory of Justice." Environmental Ethics 3(1981):155-65. Although John Rawls' A Theory of Justice does not deal specifically with the ethics of environmental concerns, it can generally be applied to give justification for the prudent and continent use of our natural resources. The argument takes two forms: one dealing with the immediate effects of which impact the present society, should be subject to environmental controls because they affect health and opportunity, social primary goods to be dispensed by society. Delayed environmental impacts, affecting future generations, are also subject to control because future generations have a just claim upon our natural resources--the generation to which a person belongs is an arbitrary contingency which should not exclude persons not yet born from consideration in the original contract of society. Manning is a free-lance science writer and editor in Knoxville, TN. (EE)

Manson, Neil A. "Formulating the Precautionary Principle." In part one, I identify the core logical structure of the precautionary principle and distinguish it from the various key concepts that appear in the many different formulations of the principle. I survey these concepts and suggest a program of further conceptual analysis. In part two, I examine a particular version of the precautionary principle dubbed "the catastrophe principle" and criticize it in light of its similarities to the principle at work in Pascal's Wager. I conclude with some suggestions for advocates of the precautionary principle who wish their formulation to avoid the pitfalls confronting the catastrophe principle. Environmental Ethics 24(2002):263-274. (EE)

Manson, Neil A., "The Precautionary Principle, The Catastrophe Argument, and Pascal's Wager," CPTS (Center for Philosophy, Technology and Society, University of Aberdeen, Scotland) Ends and Means, vol 4, no. 1, Autumn 1999, pp. 12-16. Environmentalists often invoke the precautionary principle, that,

where there are real uncertainties, especially the possibility of catastrophe, one ought to act conservatively. They favor the precautionary principle over cost-benefit analysis, thinking that cost-benefit analysis is difficult, benefits likely to be more easily estimated than harms. Further, they wish to place the burden of proof on those who wish to introduce changes. But, Manson argues, some version of cost-benefit analysis is unavoidable. Instead of resisting it, environmentalists should consider embracing it. They will be pleasantly surprised by how often cost-benefit analysis rules in their favor. Manson is Gifford Research Fellow at the University of Aberdeen. (v.11,#1)

Margaret Anne Scully, Human Rights and the Environment (Indigenous Communities), University of Southern California, Ph.D thesis, 1997. 203 pages. Indigenous communities are commonly held to live in harmony with nature and yet are not immune to the environmental degradation wrought by development. Solutions to environmental problems need not be "grand schemes" or universally applicable standards. Environmental assessments intended to facilitate the "delicate balancing" of competing interests are often culturally biased. Important international agreements have broad-based aspirations but may evolve into customary norms. "Eco-cultural security" is explored in light of the desperate circumstances of many indigenous communities. Divergent cross-cultural environmental ethics can be used to privilege mainstream environmental principles. The advisor was Sheldon Kamieniecki. (v.10,#1)

Marglin, Stephen. *The Dismal Science: How Thinking Like an Economist Undermines Community*. Cambridge, MA: Harvard University Press, 2008. Economics with its focus on individual preferences and the pursuit of self-interest perverts a natural moral order: "[T]he foundational assumptions of economics are in my view simply the tacit assumptions of modernity. The centerpiece in both is the rational, calculating, self-interested individual with unlimited wants for whom society is the nation-state." And what modernism shunned was "community." "The market undermines community because it replaces personal ties of economic necessity by impersonal market transactions." "Economics is not only descriptive; it is not only evaluative; it is at the same time constructive economists seek to fashion a world in the image of economic theory." Economics and thinking like an economist are bad for the health of the world. Marglin is in economics at Harvard University. See the review "First, Kill the Economists" by E. Roy Weintraub (*Science* Vol. 320, no. 5874 (18 April 2008): 318-19).

Margolis, Michael, "Fending Off Invasive Species: Can We Draw the Line Without Turning to Trade Tariffs?" Resources (Resources for the Future), Spring 2004, no. 153, pages 18-22. Nations can wish to ban imports that may harbor invasive species, but the environmentalist concerns have a way of combining with others interested and who wish to ban the same imports for protectionist policies. Inspection of the goods is one way without tariffs, but can be costly and ineffective. Tariffs is another way to keep out the goods that might bring in invasive species. Sorting this out. Margulis, Lynn, "Science Education, USA: Not Science, Not Yet Education, The Ecology Example," pp. 307-315 in Margulis, Lynn and Sagan, Dorion, Slanted Truths (New York: Springer-Verlag, 1997). A commentary on science education, kindergarten through graduate school, especially in ecology. "The answers to nearly all the major philosophical questions are either found in or illuminated by the science of life, especially ecology, whose stated goal is the elucidation of the relationship of organisms to environment. ... Philosophical insights garnered from the life sciences are suppressed by the arbitrary pigeonholing of rigid academic traditions? What is our relation, as Homo sapiens mammals, with our environment? How much and what sort of land is required to ensure the health and growth of a person, a family? ... These enlightening questions, of intrinsic interest, cannot even be mused in the academic-environment that requires 'covering the material'" (p. 311) Margulis teaches biology at the University of Massachusetts, Amherst. (v9,#2)

Marietta, Don E., Jr. Review of People, Penguins and Plastic Trees. Edited by Donald VanDeVeer and Christine Pierce. Environmental Ethics 9(1987):373-75.

Marietta, Don E., Jr., "Environmentalism, Feminism, and the Future of American Society." The Humanist 44, no. 3 (May/June 1984): 15-18, 30. A popularized account of the blending of environmental thought and the main ideas of feminism. More rigorous presentations can be found in Environmental Ethics, 1984-87. (Katz, Bibl # 1)

Marietta, Don E. "The Interrelationship of Ecological Science and Environmental Ethics." Environmental Ethics 1(1979):195-207. A recent trend among environmentalists (e.g., Aldo Leopold) of basing ethical norms for land use, resource management, and conservation on ecological principles such

as homeostasis is examined, and a way to justify such an ethical approach through analysis of moral judgment is explored. Issues such as the is/ought impasse, the connection between value judgments and reasons for acting, and the question of whether moral judgments are definitive and categorical are treated as they relate to an ecological ethic, i.e., an environmental ethic grounded in ecological science. I argue that such an ethic is in such regards as sound as more traditional approaches. Marietta is in the philosophy department, Florida Atlantic University, Boca Raton, FL. (EE)

Marietta, Don E., Jr., "Environmental Holism and Individuals," Environmental Ethics 10(1988):251-258. A defense of a holistic environmental ethic that does not reject humanistic ethics. Marietta criticizes extreme holism for its abstraction and reductionism; it neglects the entire range of human experience and human ethical history. Marietta offers an important analysis, but the statement of the position is too brief; it requires a more detailed and longer argument. (Katz, Bibl # 2)

Marietta, Don E., Jr., For People and the Planet: Holism and Humanism in Environmental Ethics. Philadelphia: Temple University Press, 1994. Human duty is based on a critical and holistic philosophy of nature and a humanistic ethics. The holism stresses how humans are a part of the system of nature and rejects any claim that nature exists for humans. But holism must avoid exaggerated statements of its position, recognizing that ecological science is subject to change and growth. Humanism recognizes that humans, though part of nature, are a distinct part of nature. Without making unsupportable claims that humans are morally superior to other living things, humans are different in significant ways from the rest of nature. The humanist heritage has developed moral concepts such as justice, freedom, and development of the human personality that are too valuable to be sacrificed to environmental concern. An ethics results that combines the insights of environmental ethics and of humanism. Foreword by Holmes Rolston. Marietta is in philosophy at Florida Atlantic College. (v5,#4)

Marietta, Don E. "World Views and Moral Decisions: A Reply to Tom Regan." Environmental Ethics 2(1980):369-71. Tom Regan criticizes my thesis that obligation toward the environment is grounded in a world view and thereby has a moral overridingness which mere interests and desires do not have. He holds that my approach is too subjectivistic. I counter, first, by explaining that phenomenology, which I use in my analysis of moral obligation, is not subjectivistic in the way emotivism or prescriptivism in ethics is subjectivistic. Second, I argue that world views are products of learning and experience of one shared world, that most world views share large areas of agreement, and that they can be argued for and criticized.

Marietta and Embree are both in philosophy at Florida Atlantic University. (v6,#3)

Marietta, Don E., Jr. "Ethical Holism and Individuals." Environmental Ethics 10(1988):251-58. Environmental holism has been accused of being totalitarian because it subsumes the interests and rights

of individuals under the good of the whole biosphere, thus rejecting humanistic ethics. Whether this is true depends on the type of holism in question. Only an extreme form of holism leads to his totalitarian approach, and that type of holism should be rejected, not alone because it leads to unacceptable practices, but because it is too abstract and reductionistic to be an adequate basis for ethics. Marietta is in the philosophy department, Florida Atlantic University, Boca Raton, FL. (EE)

Marietta, Don E. "Knowledge and Obligation in Environmental Ethics: A Phenomenological Approach." Environmental Ethics 4(1982):153-62. Ecological ethics, in which ecological science informs the basic principles of morality, requires a significant revision of traditional metaethics, especially regarding the views (1) that moral judgments are justified by deductive argument, and (2) that there is a dichotomy between fact and value. This interpretation of the relationship between knowledge and obligation is grounded in the phenomenology of perception with special attention to the role of a person's world view in the perception of both facts and values and the fittingness relation between perception, world view, and obligation. Marietta is in the philosophy department, Florida Atlantic University, Boca Raton, FL. (EE)

Markie, Peter J., "Feinberg on Moral Rights", Australasian Journal of Philosophy, 62 (1984) 237-45. Joel Feinberg believes that a moral right is a special kind of claim. He uses his explanation of what it is to have a moral right to defend substantive claims about the rights of animals and future generations. It is argued that Feinberg's concept of being in a position to claim is problematic. Four ways to understand this concept are examined: two of these are inconsistent with Feinberg's views on the rights of animals and members of future generations and the other two, while consistent with these views, are flawed in other ways. This leads the author to conclude that Feinberg has failed to provide a correct explanation of what it is to have a moral right which is consistent with his position on the rights of animals and future generations.

Marks, Alexandra, "Environmentalists Target Java-Drinkers to Save Birds," The Christian Science Monitor 89 (10 July 1997): 3. In the past 20 years, almost half of the old rain-forest-like coffee plantations have been replaced by high-yield, sun-grown farms. The old way provided habitat for

neotropical migratory birds. Since 1980, bird populations have dropped alarmingly: for example, Baltimore orioles have declined 20-25%, wood thrushes 40%, golden-winged warblers 50%. Other factors, too, are involved. Costa Rica has launched an "ECO-OK" project to identify shade-grown coffee to consumers. Perhaps some of the old farms can be saved, and some birds, too. (v8,#2)

Marks, Alexandra. "Environmentalists Target Java-Drinkers to Save Birds." The Christian Science Monitor 89 (10 July 1997): 3. Changes in coffee-growing methods are blamed for drops in migratory bird populations. (v8,#2)

Marks, Jonathan, What It Means to be 98% Chimpanzee: Apes, People, and their Genes. Berkeley: University of California Press, 2002. Not much more than it means for humans to be 70% fish and 25% banana, according to Marks. Humans do share many genes with animals and plants, but from this genetic similarity little follows about how similar humans are anatomically and behaviorally. The shared genes are widely used in various life forms, our protein molecules are indeed similar to those in chimps. But our cognitive and cultural capacities are very different. For Marks this also weakens the argument that chimpanzees deserve human rights and equal protections. Marks is a molecular anthropologist.

Marks, Jonathan, What It Means to be 98% Chimpanzee: Apes, People, and their Genes. Berkeley: University of California Press, 2002, 2003. If we are 98% chimp, then we should go naked and sleep in trees 98% of the time? Numbers depend on perspective. Humans have three times as much brain size as chimps, so by that standard we are 300% more than chimps. Obviously humans are quite different from chimps in their mental capacities and cultural developments, so the 98% figure is only true in a quite limited sense. Marks is in anthropology at the University of North Carolina, Charlotte. (v. 15, # 3)

Markus, Tomislav, "Ekoloska etika -- razvoj, mogucnosti, ogranicenja (Environmental Ethics, Development, Possibilities, Limitations), Socijalna Ekologija (Journal for Environmental Thought and Sociological Research (Zagreb, Croatia) 13(No. 1, 2004):1-23 (in Croatian) (missing diacritical marks in the titles) Overview of environmental ethics in English-speaking countries for the last three decades. Baird Callicott, Holmes Rolston, Eric Katz, Andrew Light, Robin Attfield and others. Environmental ethicists have given a valuable critique of environmental destructiveness of modern society and anthropocentric tendencies in Western moral philosophy and pointed to many inconsistencies in Western thought about the human relation to nature. The main insufficiency in their work is the lack of a radical enough critique of technical civilization. A second insufficiency is an idealistic approach which underestimates the material factors. Markus is at the Kroatisches Institut fur Geschichte, Zagreb. (v. 15, # 3)

Marler, Peter., "Social Cognition: Are Primates Smarter than Birds?" pages 1-32 in Nolan, Jr., Val, Ketterson, Ellen D., eds., Current Ornithology, vol. 13. New York: Plenum Press, 1996. "There are many striking similarities between the accomplishments of birds and primates. Their achievements in different forms of social learning are surprisingly similar with regard to the acquisition of both patterns of responsiveness to environmental stimulation and new motor patterns. Examples of tool use are as frequent and as complex in birds as in primates, although questions of social transmission remain moot in both cases. Primates seem to excel, however, in aspects of social cognition. There are cases of complex social cognition where primate accomplishments appear to be outstanding. . . . Accomplishments in the domain of social communication are just as impressive in birds as in monkeys and apes, and the ability for vocal learning is an outstanding avian achievement that leaves non-human primates far behind. I am driven to conclude, at least provisionally, that there are more similarities than differences between birds and primates. Each taxon has significant advantages that the other lacks" (p. 22). (v.8,#4)

Marques, Soromenho Viriato, "Justica e Sentido da Terra (Justice and a Sense of the Earth)," Philosophica (Lisbon: Departamento de Filosofia, Faculdade de Letras da Universidade de Lisboa) 1, 1993, pp. 31-44. What is the significance today of the problem of justice, as we now have to consider it? This analysis attempts to clarify the foundation of this question, specifically through determining the interrelationships between the enormous environmental-political problems of our century and the principles of the philosophy of nature and of the philosophy of politics in the modern era. This includes an analysis of the failure of political science, of autonomy and secularization, of practical and political reason, and of the eclipse of nature within the framework of anthropological idealism. The author is professor of philosophy at the University of Lisbon. Address: Departamento de Filosofia, Cidade Universitaria, 1699, Lisboa Codex, Portugal. Home address: Praceta Dr. Joaquim Ferreira de Sousa, Lote 7-4.E C, Urbanizaçao Quinta de Vanicelos, P-2900 Setúbal, Portugal. (v4,#4)

Marquette University, Interdisciplinary Minor in Environmental Ethics, Generating and Using Electricity in the United States." A report prepared by students in the first capstone seminar for the Interdisciplinary Minor in Environmental Ethics. Accessible through: <http://www.inee.mu.edu/Capstone%202003/Proposal.htm>

An ambitious project that spanned the 2003 Spring semester, ten students identified the religious and philosophical foundations for approaching electricity use and generation from an ethical perspective (appropriated from Jesuit spirituality, Aldo Leopold, and the Roman Catholic principle of subsidiarity), researched relevant topics on use and generation by renewable and non-renewable sources, produced seventeen reports, and concluded to ninety-two recommendations through an iterative, consensus process.

Affirmation of their efforts by US Senator Russ Feingold's environment aide, Mary Frances Repko, proved to be a highlight of the capstone experience. She flew to Milwaukee while in the process of participating in the mark-up of the Senate's energy bill and engaged them in an in-depth discussion on their recommendations. When pressed for at least one to include in the bill, the students opted for an awareness alert on electricity bills that quantified environmental effects from the amount of electricity used. Jame Schaefer was the advisor. (v 14, #3)

Marquis, Robert J., and Christopher J. Whelan, "Insectivorous Birds Increase Growth of White Oak through Consumption of Leaf-Chewing Insects," Ecology 75(1994):2007-2014. The authors find that insect-eating birds substantially reduce the insects that eat tree leaves, and thus, by regulating insects, substantially increase the growth of oaks. The research suggests that the migrating songbirds that (used to) fill the North American forests each spring are not simply decorative frills playing some minor role in the ecosystems, but that they play a crucial role in maintaining the health and productivity of forest trees. But such birds, unfortunately, have been in recent decline. Marquis is in biology at the University of Missouri-St. Louis. Whelan is at the Morton Arboretum, Lisle, Illinois. For a popular summary, see Sharon Begley, "Why Trees Need Birds," National Wildlife 33 (no. 5, Aug.-Sept., 1995):42-45. (v5,#4)

Marsh, John. "No Wilderness, All Heritage", Environments 24(no. 1, 1996):39.

Marshall, Alan Hilary, The Concept of Environmental Ethics, M.A. thesis at the University of South Africa (UNISA), Pretoria, 1993. 133 pages. Human development and excesses threaten not only the continued existence of the human species but that of all other forms of life on earth. Environmental ethics ought to confront and contain this threat. There are two opposed kinds of philosophical positions: a nature-centered ethic, here called biocentrism, from which environmental ethics was developed, and homocentrism, which has arisen in opposition to biocentrism. Marshall argues for a homocentric view. The homocentric view is the world view that the peoples and nations of the world currently adopt; morality is largely worked out in that context, and it is the view most likely to be successful in environmental conservation. The supervisors were Z. Postma de Beer and P. Voice. (v6,#3)

Marshall, Alan, "A Postmodern Natural History of the World: Eviscerating the GUT's from Ecology and Environmentalism," Studies in History and Philosophy of Biological and Biomedical Sciences 29 (no. 1, 1998):137-164. The plant ecologist Henry Gleason in 1926 was already a postmodernist. If we characterize postmodernism as an emphasis on heterogeneity, ephemerality, and anti-foundationalism, pluralism, fragmentation, indeterminacy, schizophrenia, chaos, antiformalism, discontinuity, absence, playfulness, irony, localism, anarchy and ontological meaninglessness, Gleason's theory reflects such ideas in the ecological arena. There remains a need for a neo-Gleasonian postmodern approach in which ecological phenomena are examined using non-determinant, pluralist and local perspectives and that reject the foundationalism and unifying approach of modernist science. This posits a view of the Earth's biota highlighting fragmentation, anarchism, and non-interaction. Community ecology, as opposed to the unifying and totalizing tendencies of ecosystems ecology, can claim to be the intellectual site of such a postmodern natural history. But there is a final irony. There cannot be a postmodern natural history, since natural history is fractured into undefinable and indefinite fragmented associations which defy generalization. Marshall is in science and technology studies, University of Wollongong, Sydney, Australia. (v.9,#3)

Marshall, Brent K. "Globalisation, Environmental Degradation and Ulrich Beck's Risk Society." Environmental Values 8(1999):253-275. ABSTRACT:This paper is organised in three interconnected parts. First, contemporary political economic approaches to understanding the structure of the global economic system are outlined and synthesised. Specifically, it is suggested that the current structural configuration of the globe is a transitional phase between the spatially-bounded configuration hypothesised by world-system theory and the configuration hypothesised by globalisation theorists. Second, the contemporary problem of environmental degradation is situated in a global structural context. Third, an outline and critique of Ulrich Beck's theory of the "Risk Society" is presented to illustrate the increasing inadequacy of nation-state-centric theories in explaining the dynamic linkage between global capitalism and local environmental degradation. KEYWORDS: Globalisation, environmental degradation, nation-state, world-system. Brent K. Marshall, Department of Sociology University of

Tennessee 901 McClung Tower, Knoxville, TN 37920, USA Email: marshall@utkux.utcc.utk.edu (EV)

Marshall, Peter, Demanding the Impossible: A History of Anarchism. London: Harper Collins. 767 pages. £ 25.00 hardcover, also in paper by Fontana, £ 10.00. Chapters on Taoism, Proudhon, Kropotkin, Gandhi, and Murray Bookchin. (v4,#1)

Marshall, Peter, Nature's Web: An Exploration of Ecological Thinking (London: Simon & Schuster, 1992) has been republished in the US as Nature's Web: Rethinking Our Place in Nature (New York: Paragon House, 1994), \$29.95. A paperback edition published by Cassell is coming out this year in UK. The book has received some excellent reviews, and Choice calls it "a wonderful history of 'green' ideas."

Marshall, Peter. Nature's Web: Rethinking Our Place on Earth. Armonk, NY: M.E. Sharpe, 1996. 523 pp. \$21.95 paper. Claims to be the first comprehensive overview of the intellectual roots of the worldwide environmental movement--from ancient religions and philosophies to modern science and ethics--and to synthesize these into a new philosophy of nature adequate for a contemporary grounding of moral values and social action. (v7,#4)

Marshall, Peter. Riding the Wind: A New Philosophy for a New Era. London and New York: Cassell, 1998, 263pp. In this account of his mature thinking, Peter Marshall develops a dynamic and organic philosophy for the third millennium which he calls liberation ecology. Deep, social, and libertarian, liberation ecology seeks to free nature, society and individuals from their existing burdens so that they can all realize together their full potential. Riding the Wind presents a fresh and inspired vision which combines ancient wisdom and modern insights, reason and intuition, science and myth. Chapters include: The Way of the Universe, Nature's Web, Creative Evolution, Playful Humanity, Reverence for Being, The Family of Life, After the Leviathan, The Common Treasury, Dwelling Lightly on Earth, Learning to Live, The Alchemy of Love. John Clark, Professor of Philosophy at Loyola University, New Orleans, says: "Riding the Wind is a well written and accessible work that makes a strong statement of Peter Marshall's important and distinctive position in contemporary ecological thought. The book deserves to be read and discussed widely." Marshall is a full-time writer, and his many books include the highly

acclaimed Nature's Web: Rethinking our Place on Earth and Demanding the Impossible: A History of Anarchism. (v9,#2)

Martin, Brendan. "From the Many to the Few: Privatization and Globalization", The Ecologist 26(no. 4,1996):148. North and South, East and West, the public sector is under assault. In the name of greater "efficiency", public services have been "contracted out": development projects "franchised" to private companies; state spending slashed; user charges for basic services introduced or increased; and markets "deregulated". In the process, power and wealth have become increasingly concentrated and the ability of nation states to protect the public interest has been undermined. The chief beneficiaries have been transnational corporations which have used the auctioning-off of the state sector to integrate their operations further. (v7,#4)

Martin, Calvin Luther, In the Spirit of the Earth, Reviewed by Jim Cheney in Environmental Ethics 16(1994):321-327.

Martin, Calvin Luther, In the Spirit of the Earth: Rethinking History and Time. Baltimore: Johns Hopkins University Press, 1992. 152 pages. \$ 19.95. Teachers and writers of history must go beyond history-as-usual to speak of the much deeper story of humans and their connections to the earth. Martin earlier wrote Keepers of the Game, on native American relationships with the animals. The more participatory sense of the natural world held by small hunting groups led more clearly to the fundamental truth that nature conserves humans. (v4,#1)

Martin Enserink, "The Lancet Scolded Over Pusztai Paper," Science 286(22 October, 1999):565. Britain's most prestigious medical journal, The Lancet, published a transgenic food paper by Stanley Ewen and Arpad Pusztai claiming that rats fed transgenic potatoes had abnormalities in their intestines. The authors, especially Pusztai, have also claimed that transgenic potatoes can stunt rats' growth and impair their immune systems. Critics say the paper is deeply flawed. The Lancet editors admit the paper is controversial but reply that five of six referees (twice the usual number) recommended publication, if only to get the claims evaluated. There is currently a heated debate over transgenic foods in the U. K. See Ewen, Stanley W. B., and Pusztai, Arpad, "Effects of Diets Containing Genetically Modified Potatoes Expressing Galanthus nivalis Lectin on Rat Small Intestine," The Lancet 354 (October 16, 1999):1353-1354. The authors are pathologists at the University of Aberdeen. (v10,#4)

Martin, Evelyn and Timothy Beatley, "Our Relationship with the Earth: Environmental Ethics in Planning Education," Journal of Planning Education and Research 12(1993):117-126. The results of a study of the extent to which university planning programs are contributing to new ethical relationships through the teaching of environmental ethics. Eighty-one programs were surveyed. The links between environmental ethics and environmental planning are often weaker than they can be and ought to be. Implications for planning education and recommendations for future curriculum development. The survey involves some rather sophisticated inquiry about where (in which departments) environmental ethics is and is not taught on which campuses. "Exposure to such ethical theories, concepts, and tools is as essential to the long term productivity, effectiveness, and relevance of planners as are the more conventional skills-based courses." Martin is with the Center for Respect of Life and Environment, a division of the Humane Society of the United States; Beatley is chair of the Department of Urban and Environmental Planning at the University of Virginia. Also involved is Bruce K. Ferguson, Landscape Architecture, University of Georgia. This study was also the subject of panels at the Annual conference, Council of Educators in Landscape Architecture, Charlottesville, VA, October 17-20, 1992 and at the Association of Collegiate Schools of Planning, Columbus, OH, October 30-November 1, 1992. Those interested in further information and in the Land Ethics program are invited to contact Evelyn Martin, Center for Respect of Life and Environment, 2100 L Street, N.W., Washington, DC 20037. Phone 703/329-3320. (v4,#1)

Martin, Evelyn, "The Last Mountain," American Forests, April 1993. "The Mt. Graham red squirrel controversy [building a telescope that threatens a subspecies of red squirrel] raises fundamental questions about whether we humans should reach for the stars without coming to know the land at our feet." Martin, John N. Review of Environment and Ethics-A New Zealand Contribution. Edited by John Howell. Environmental Ethics 10(1988):357-62.

Martin, John N. "The Concept of the Irreplaceable." Environmental Ethics 1(1979):31-48. An analysis is proposed for the common argument that something should be preserved because it is irreplaceable. The argument is shown to depend on modal elements in irreplaceable, existence assumptions of preserve, and the logic of obligation. In terms of this theory it is argued that utilitarianism can account for most, but not all instances of persuasive appeals to irreplaceability. Being essentially backwards looking, utilitarianism cannot in principle justify preservation of objects irreplaceable because of their history or genesis. Martin is in the philosophy department, University of Cincinnati, Cincinnati, OH. (EE)

Martin, John N. "Order Theoretic Properties of Holistic Ethical Theories." Environmental Ethics 13(1991):215-34. Using concepts from abstract algebra and type theory, I analyze the structural presuppositions of any holistic ethical theory. This study is motivated by such recent holistic theories in environmental ethics as Aldo Leopold's land ethic, James E. Lovelock's Gaia hypothesis, Arne Naess' deep ecology, and various aesthetic ethics of the sublime. I also discuss the holistic and type theoretic assumptions of such standard ethical theories as hedonism, natural rights theory, utilitarianism, Rawls' difference principle, and fascism. I argue that although there are several common senses of part-whole in ethical theory, the central sense of holism in ethics is that of a theory that defines its key moral idea as an emergent group property grounded in the relational properties of its individual constituents. Hedonism and Kantianism do not count as holistic in this sense. Natural rights theory does in a degenerate way. Utilitarianism and various environmental ethics are paradigm examples. I point out as a general structural weakness of environmental holistic theories that their first-order grounding in nonmoral vocabulary seems to preclude an explanation of many moral intuitions about human ethics. Martin is in the philosophy department, University of Cincinnati, Cincinnati, OH. (EE)

Martin, Michael, "Ecosabotage and Civil Disobedience," Environmental Ethics 12(1990):291-310. One of the few analyses of the morality of ecosabotage. Martin discusses the relationship between ecosabotage and civil disobedience, with the crucial distinction that civil disobedience is a public act, while ecosabotage is not. There are no general arguments against ecosabotage, but there are also no specific justifications for it. Martin argues on utilitarian grounds and ignores (generally) the non-anthropocentric value systems of most ecosaboteurs. But it is the radicalism of the goal---a non-anthropocentric ethic---that requires the disobedient action. (Katz, Bibl # 2)

Martin, Michael. "Ecosabotage and Civil Disobedience." Environmental Ethics 12(1990):291-310. I define ecosabotage and relate this definition to several well-known analyses of civil disobedience. I show that ecosabotage cannot be reduced to a form of civil disobedience unless the definition of civil disobedience is expanded. I suggest that ecosabotage and civil disobedience are special cases of the more general concept of conscientious wrongdoing. Although ecosabotage cannot be considered a form of civil disobedience on the basis of the standard analysis of this concept, the civil disobedience literature can provide important insights into the justification of ecosabotage. First, traditional appeals to a higher law in justifying ecosabotage are no more successful than they are in justifying civil disobedience. Second, utilitarian justifications of ecosabotage are promising. At present there is no a priori reason to suppose that some acts of ecosabotage could not be justified on utilitarian grounds, although such ecosaboteurs as Dave Foreman have not provided a full justification of its use in concrete cases. Martin is in the philosophy department, Boston University, Boston, MA. (EE)

Martin, Paul S., *Twilight of the Mammoths: Ice Age Extinctions and the Rewilding of America*. Berkeley,

CA: University of California Press, 2005. North America lost most of its large mammals near the close of the last ice age: mastodons, mammoths, giant ground sloths, car-sized glyptodonts, rhino-sized marsupials, giant kangaroos, gorilla-sized lemurs. Martin is an enthusiastic advocate of "blitzkrieg," that nearly arrived humans rapidly killed off naive prey unfamiliar with this new predator. (Others find few such kill sites, are less sure how when and how rapidly humans invaded the Americas, and doubt that prey species stay naive very long.) Since humans were a leading cause of such extinctions, Martin also argues that where such species still exist elsewhere, they should be restored to North America (and Eurasia) in Quaternary parks filled with wild horses, camels, elephants, lions, and cheetahs.

Martin, Paul S., and Szuter, Christine R., "War Zones and Game Sinks in Lewis and Clark's West," Conservation Biology, February 1999. Native American warfare's unnatural ecological effects. The number and distribution of bison and other big animals was likely determined by the presence of buffer zones between warring Native tribes. In an individual tribe's homeland, populations of bison and elk were often in serious decline. But in the war zones between tribes, where hunters seldom went, these animals flourished. The conclusion, say these most recent advocates of this "war zone theory," is that the scarcity or abundance of large animals seen by the Lewis and Clark expedition was not "truly natural, that is, falling outside human influence or control. ... The West in the time of Lewis and Clark was long past any purely 'natural condition' that might serve as an absolute benchmark for planners." One of the study's authors--an advocate of the "blitzkrieg" theory that newly arrived human hunters drove North America's megafauna such as mammoths and mastodons extinct some 13,000 years ago--suggests conservationists might want to restore pre-Native American nature preserves by importing elephants who would mimic the extinct megafauna. See also Stevens, W. K., "Unlikely Tool for Species Preservation: Warfare," New York Times, 3/30/99. (v.10,#2)

Martin, Paul S., and Christine R. Szuter. "War Zones and Game Sinks in Lewis and Clark's West." *Conservation Biology* Vol. 13, no. 1 (1999): 36-45. Native Americans often over-hunted their lands, and the most abundant game was often in the contested territories between tribes, where they were reluctant to hunt. In the absence of Native Americans, bison, elk, deer, and wolf populations would have been larger. With evidence from the Lewis and Clark journals.

Martin, Thomas E. and Finch, Deborah M., eds., Ecology and Management of Neotropical Migratory Birds: A Synthesis and Review of Critical Issues. New York: Oxford University Press, 1995. \$28.00 paper \$52.00 cloth. 512 pages. The apparent decline in numbers among many species of migratory songbirds is a timely subject in conservation biology, particularly for ornithologists, ecologists, and wildlife managers. This book is an attempt to discuss the problem in full scope. It presents an ambitious, comprehensive assessment of the current status of neotropical migratory birds in the U.S., and the methods and strategies used to conserve migrant populations. Each chapter is an essay reviewing and assessing the trend from a different viewpoint, all written by leaders in the fields of ornithology, conservation, and population biology. Thomas E. Martin is from University of Montana, and Deborah M. Finch is from USDA Forest Service, Arizona. (v7,#1)

Martin, Vance C., and Alan Watson, "International Wilderness." In Hendee, John C. and Chad P. Dawson, Wilderness Management: Stewardship and Protection of Resources and Values. 3rd ed. Fulcrum Publishing, 2002. Internationally "there is increasing acceptance of the term [wilderness] to mean those areas legislated or zoned for protection in their natural condition, [yet] accommodating a wider spectrum of human activity than the U.S. definition might allow." (v. 15, # 3)

Martin, Vance G., "Australia's Wilderness Movement--Gathering Momentum," International Journal of Wilderness 2, no. 1 (May 1996):10-14. Australia's wilderness movement emphasizes some uniquely Australian features, on a continent as large as the United States but with 10% of the U.S. population, largely semiarid or arid, but with rainforest as well and with an unusual fauna and flora. Designation is principally at the state level, and increasingly recognizes the histories of the aboriginal peoples. Good summary of political and philosophical issues, as well as of designated areas. Martin is with the International Center for Earth Concerns and the WILD foundation, Ojai, CA. (v7,#2)

Martin, Vance, Tyler, Nicholas, eds. Arctic Wilderness--The 5th World Wilderness Congress. Ojai, California: The WILD Foundation, Nov. 1995. \$32. The aim of the 5th WWC was to enhance awareness of the natural beauty, natural resources, and the aesthetic and scientific importance of the Arctic and Antarctica. Examples of discoveries and developments in both basic and applied science, of exploitation of renewable and nonrenewable natural resources, and of new information discovered. There are clear warnings about the consequences of human activity at high latitudes. (v7,#4)

Martin, Vance G., and Nicholas Tyler eds. Arctic Wilderness , the 5th World Wilderness Congress. Golden, CO: North American Press, 1995. (v6,#3)

Martin, Vance, Cyril F. Kormos, Franco Zunino, Till Meyer, Ulf Doerner, and Toby Aykroyd. "Wilderness Momentum in Europe." *International Journal of Wilderness* Vol. 14, no. 2 (2008): 34-38, 43. The fall of the Iron Curtain revealed large, intact wilderness areas in central and Eastern Europe. Most Eastern Bloc countries wish to be in the European Union, which pays considerable attention to conserving natural areas. Changes in agriculture have resulted in the rewilding of some former agricultural areas. There is an increased number of NGOs interested in wilderness.

Martin, Vance G. *The Wild Planet Project*, Special Publication of the WILD Foundation, in cooperation with the *International Journal of Wilderness*. Boulder, CO: The Wild Foundation, 2007. (See also <www.wild.org>.) The Wild Planet Project focuses on wilderness in international and global contexts, and here are a dozen short articles summarizing that experience over several decades, which has led up to the Wild Planet Project. Vance discusses the benefits of wilderness (especially in and to third world countries), policy tools for wilderness designation, ocean wilderness, private sector wilderness, wilderness and biodiversity, and more.

Martinez, Eluid. "Coping with Scarcity on the Rio Grande/Rio Bravo." Natural Resources Journal 39(No. 1, Winter 1999):117- . (v10,#4)

Martinez, Graciella, "Ecoturismo en la Sierra Tarahumara" published in El Heraldo, a newspaper of Chihuahua, Mexico, February 7, 1998. Available on website at:

http://www2.planeta.com/mader/planeta/0898/0898_Tarahumara.html

A warning for the local communities and the State Government of Chihuahua, Mexico, about the possible adverse consequences of ecotourism. There are negative impacts on the Tarahumara indigenous peoples and on the environment in the Copper Canyon area, and such impacts are typical of many others elsewhere around the globe. Ecotourism needs careful regulation if its benefits are to be realized. Martinez also read a paper at the South West Texas and New Mexico Philosophical Society, El Paso, Texas, in April 1998, "Bringing Environmental Ethics down to Earth," arguing that grand theories in environmental ethics are not particularly helpful in solving the on-the-ground problems of ecotourism. Martinez is a Mexican philosopher, who has recently completed a master's degree in the philosophy of environment and development at Colorado State University. (v.9,#3)

Martinez-Alier, Joan, The Environmentalism of the Poor: A Study of Ecological Conflicts and Valuation. Cheltenham, UK: Edward Elgar, 2002. Reviewed by Pat Devine. Environmental Values 13(2004):269-274. (EV)

MartinezAlier (Martinez-Alier), J., "Distributional Obstacles to International Environmental Policy: The Failures at Rio and Prospects after Rio." Environmental Values Vol.2 No.2(1993):97-124. ABSTRACT: The concept of 'sustainable development' as used by the Brundtland Commission was meant to separate environmental policy from distributional conflicts. Increases in income sometimes are beneficial for the environment (for instance, they allow the use of domestic cooking fuels which in some ways are less damaging to the environment), but higher incomes have meant higher emissions of greenhouse gases, and higher rates of genetic erosion. In the aftermath of the Rio conference of June 1992, this article analyses some unavoidable links between distributional conflicts and environmental policy. Often, environmental movements have tried to keep environmental resources and services outside the market, but there are now attempts to establish property rights on, and to give money values to, environmental resources and services, such as agricultural genetic resources and the CO2 absorption facility provided by the oceans and new vegetation. European 'green' proposals to impose an 'eco-tax,' and proposals from India to create a world market for CO2 emission permits are considered. The issue raised by the growing Third World agroecology movement, of payment of 'farmers' rights' for in situ agricultural biodiversity is discussed. The article includes a short discussion of the North American free trade agreement (NAFTA) between Mexico and the USA. in so far as it involves so-called 'ecological dumping,' i.e. trading at values which do not include environmental costs. In the last sections, the article asks how prices in ecologically-extended markets would be formed, how much such prices will depend on distribution, and how much (or how little) such payments would change distribution of income. Environmental movements of the Poor are faced with the dilemma of keeping environmental resources and services out of the market, or else asking for property rights to be placed on them. KEYWORDS: property rights, environmental movements, greenhouse effect, agricultural biodiversity, environmental policy, poverty and environment, ecological debt. Marzluff, John M., and Tony Angell, *In the Company of Crows and Ravens*. New Haven: Yale University Press, 2005. The authors claim there is much culture in crows and raven, where culture means "socially transmitted behavior patterns," also that "to know the crow is to know ourselves," partly because humans have so long and so often interacted with corvids. Marzluff is a wildlife biologist at the University of Washington; Angell is an artist and writer from the San Juan Islands of Washington.

Marzluff, John, and Hamel, Nathalie, "Land-Use Issues," Encyclopedia of Biodiversity 3: 659-674. Land use issues concern the processes by which human activities determine land cover. Important issues are agricultural development and intensification, settlement, and extraction of natural resources. In response to human land use, the earth's land cover has changed from a mosaic of native woodlands, forests, and grasslands to an increasingly impacted mixture of degraded and fragmented native habitats, exotic croplands, and impervious urban surfaces. In the last three centuries, models suggest that forests have declined 19%, grasslands have declined 8%, and cropland has increased over 400%. This article discusses how land use processes have changed through time and how they have caused the natural pattern of land cover to change. This transformation of the planet's landscape is widely recognized as the primary driver in the current global loss of biodiversity. Several examples of how land use can influence biodiversity are also considered. (v.11,#4)

Mase, Hiromasa, "Ecophilosophy as Liberal Arts Philosophy," Philosophical Inquiry 11(nos. 1-2, Winter-Spring 1989):28-36. "Confronted with today's ecological problems, basically what we are seeking is the ecological attitude, 'we, as a part, also live for the whole'. ... 'Mankind bears a moral responsibility for the world of the future, and also for the whole of nature'" (p. 34). Mase is at Keio University, Tokyo.

Mase, Hiromasa. Keio University, Japan, "Nature and Ethics: Whiteheadian Approach," Annals of the Japan Association for Philosophy of Science (Tokoyo) 7(March, 1988):155-161. Argues for an environmental ethics based on intrinsic value in nature, using a Whiteheadian philosophy, with some attention to Aldo Leopold. A key category is "experience" in the Whiteheadian sense. (v1,#2)

Maser, Chris, The Redesigned Forest. San Pedro: R. & E. Miles, 1988. P., xx, 234. Maser is a former employee of the Bureau of Land Management, a zoologist and expert on forest ecology. This book is an argument for a more enlightened policy of sustainable forestry. Maser criticizes current philosophical attitudes to forestry, the so-called "plantation mentality," but his alternative of sustainable forest management is still locked into an overly mechanistic and anthropocentric conception of nature. "We need to learn to see the forest as the factory that produces raw materials...for a common goal...a sustainable forest for a sustainable industry for a sustainable environment for a sustainable human population" (pp. 148-149). A good example of the limitations of "resource environmentalism."

Maser, Chris, Sustainable Forestry: Philosophy, Science, and Economics. Delray Beach, FL: St. Lucie Press, 1994. 373 pages. \$ 39.95. Maser dislikes intensive forestry and proposes policies that would lead to lower, although probably more sustainable, harvest levels. He recognizes the legitimate role humans play in ecosystems and is concerned for the protection of scarce resources such as old growth forestry and biodiversity; he is also concerned about the fallacy of every-increasing human populations and economic activity. Maser is a forest ecologist. (v6,#4)

Maser, Chris, The Redesigned Forest. San Pedro, CA: R. and E. Miles Publishers, 1988. In the redesigned forest, natural forces are mimicked successfully and are also highly controlled.

Maser, Chris. Sustainable Community Development. Delray Beach, FL: St. Lucie Press, 1997. 280pp. \$39.95 paper. Maser presents a clear picture of a community-directed process of development based on human values, active learning, shared communication and cooperation within a fluid system that becomes shared societal vision both culturally and environmentally. (v8,#1)

Maser, Chris. Resolving Environmental Conflict: Towards Sustainable Community Development. Delray

Beach, FL: St. Lucie Press, 1996. Maser examines notions of development sustainability, and community and the synergism of ecology, culture and economic needs that promote a healthy environment enriching the lives of all its inhabitants. (v7,#1)

Masolo, D. A., African Philosophy in Search of Identity. Bloomington, Indiana: Indiana University Press, 1994, and Edinburgh: Edinburgh University Press, 1994. Is there an African philosophy? A Kenyan philosopher analyzes this debate, its history and current status. African thinkers have used philosophy as the primary vehicle for theoretical articulation of their identities as the means for contesting identities imposed by outsiders. Among the philosophers studied is H. Odera Oruka, who has an interest in environmental philosophy. African philosophy has grown out of unique cultural circumstances and now embraces many different constructions of African reality, problems, and methods of acquiring meaningful knowledge. Masolo is in philosophy at the University of Nairobi, also he has been visiting professor at Antioch College. (v6,#3)

Mason, Michael, "Democratising Nature? The Political Morality of Wilderness Preservationists," Environmental Values 6(1997):281-306. ABSTRACT: Deep ecological appeals for wilderness preservation commonly conjoin arguments for participatory land use decision-making with their central championing of natural areas protection. As an articulation of the normative meaning of participatory democracy, the discourse ethics advanced by Jürgen Habermas is employed to highlight the consistency and justifiability of this dual claim. I argue that Habermasian moral theory reveals a key tension between, on the one hand, an ethical commitment to wilderness preservation informed by deep ecological and bioregional principles that is oriented to a naturalistic value order and, on the other, the procedural norms of democratic participation. It is claimed that discourse ethics thereby raises critical philosophical and practical questions concerning the political legitimacy of deep ecology. In examining the progressive claims of environmental philosophers and wilderness activists embracing this perspective, I draw empirically upon Canadian arguments for natural areas protection and associated radical prescriptions for a democratisation of land use decision-making. Matheny, Gaverick, and Kai M. A. Chan, "Human Diets and Animal Welfare: The Illogic of the Larder," Journal of Agricultural and Environmental Ethics 18(2005):579-594. Few moral arguments have been made against vegetarian diets. One exception is the Logic of the Larder: We do animals a favor by purchasing their meat, eggs, and milk, for if we did not purchase these products, fewer animals would exist. This argument fails because many farm animals have lives that are probably not worth living, while

others prevent a significant number of wild animals from existing. Even if this were not so, the purchase of animal products uses resources that could otherwise be used to bring a much greater number of animals into existence. Keywords animal welfare - farm animals - utilitarianism - vegetarianism - wildlife. Matheny is in the Department of Agricultural and Resource Economics, University of Maryland. Chan is with the Center for Conservation Biology, Stanford University, also with the Institute for Resources Environment and Sustainability, University of British Columbia. (JAEE)

Matheny, Gaverick, "Least harm: A defense of vegetarianism from Steven Davis's omnivorous proposal." Journal of Agricultural and Environmental Ethics 16(2003):505-511. Steven Davis argues that the number of animals killed in ruminant-pasture production is less than the number of animals killed in crop production. Davis then concludes the adoption of an omnivorous diet would cause less harm than the adoption of a vegetarian diet. Davis's argument fails on three counts: first, Davis makes a mathematical error in using total rather than per capita estimates of animals killed; second, he focuses on the number of animals killed in production and ignores the welfare of these animals; and third, he does not count the number of animals who may be prevented from existing. KEY WORDS: animal production, animal rights, animal welfare, least harm, population, utilitarianism, vegetarianism. (JAEE)

Mathews, Freya, For Love of Matter: A Contemporary Panpsychism. Albany: State University of New York Press, 2003. "To adopt a panpsychist outlook is to enter the terrain of 'spirituality,' since it opens up this possibility of communicative engagement with a responsive world that invites us to assume an attitude of eros in relation to it. In considering this invitation however, we are immediately confronted with the traditional problem of evil: why should we make ourselves available and vulnerable to a world that can and does visit so much suffering and harm upon us? How can we affirm the erotic intent of the One in creating us, in the light of the tortured testimony of the created?" (p. 10). A useful account is the story of Eros and Psyche, recorded by Lucius Apuleius in the second century A.D. "This story reveals how it is possible to sustain an erotic engagement with the world, consonant with a panpsychist outlook,

in full knowledge of the possibilities of suffering and death that this world holds for us" (p. 10). Mathews is in philosophy, La Trobe University, Australia.

Mathews, Freya, "Conservation and Self-Realization: A Deep Ecology Perspective," Environmental Ethics 10(1988):347-355. An excellent discussion of the basic tenets of deep ecology---self-realization and identification with the wider world---and the apparent dilemma this creates for conservation policies. Deep ecology assumes that "identification" with nature leads to conservation as a matter of self-defense, but if nature as a whole would continue without humanity, why is it important to conserve for the survival of humanity? Mathews argues that "identification, in the context of deep ecology, is premised on a convergence of interests" (p. 353). An individual's interests lead to a wider identification; but one cannot then nullify the more local concerns for the sake of more cosmic ones. Mathews also bases the argument on the unargued claim that the universe as a whole is a self-realizing entity, endowed with conatus. Cosmic identification does seem to "lose" the individual. Mathews ends by saying that the loss of life on Earth can be viewed with equanimity, but this is a strange way to argue for environmentalism. (Katz, Bibl # 2)

Mathews, Freya, The Ecological Self. London: Routledge, 1990, published in the United States by Barnes and Noble, Savage, Maryland, 1991. Mathews claims here the first book-length treatment of the metaphysical foundations of ecological ethics. The author seeks to provide a metaphysical illumination of the fundamental ecological intuition that we are in some sense "one with" nature and that everything is connected to everything else. She considers and rejects the dominant atomistic metaphysics implicit in Newtonian physics. Drawing on Einsteinian cosmology, modern systems theory, and the philosophy of Spinoza, she elaborates a new metaphysics of interconnectedness. The normative implications of this new metaphysics for our conceptions of nature and the self are analyzed in this provocative study. (v2,#3)

Mathews, Freya, "Beyond Modernity and Tradition: A Third Way for Development," Ethics and the Environment 11(2006):85-113. How we understand the world (our metaphysical premise) determines, to a large degree, how we treat it. How we treat our world constitutes our basic modality. Our basic modality colors everything we do--our entire culture takes its cue from it. Three basic modalities are here distinguished. The first is the modality of pre-materialist or traditional, religion-based societies. This is a modality of importuning, the seeking of assistance from supernatural sources. The second is the modality of materialist or modern, secular societies. This is a modality of instrumentalism, involving mastery, control, and a will to re-make the world in accordance with human ends. The third is the modality of prospective post-materialist societies. These societies would be post-religious but not post-spiritual. Their modality would be one of letting the world unfold according to its own nature, and, by extension, finding creative synergies between human and nonhuman conativities. This modality of synergy is explicated by reference to the Daoist notion of wu wei. Mathews is in philosophy, La Trobe University, Australia. (Eth&Env)

Mathews, Freya, "Vale Val: In Memory of Val Plumwood," Environmental Values 17(2008):317-321. On 29 February 2008, Val Plumwood died of stroke at the age of 68. She was not only a seminal environmental thinker, whose book *Feminism and the Mastery of Nature* has become a classic of environmental philosophy; she was also a woman who fearlessly lived life on her own deeply considered terms, often in opposition to prevailing norms. In this obituary Freya Mathews discusses Val's life and her contributions to environmental philosophy.

Mathews, Freya, "Thinking from Within the Calyx of Nature," Environmental Values 17(2008): 41-65. Is philosophy an appropriate means for inducing the 'moral point of view' with respect to nature? The

moral point of view involves a feeling for the inner reality of others, a feeling which, it is argued, is induced more by processes of synergistic interaction than by the kind of rational deliberation that classically constituted philosophy. But how are we to engage synergistically with other-than-human life forms and systems? While synergy with animals presents no in-principle difficulty, synergy with larger life systems takes us into epistemological realms explored only in the margins of the Western tradition, such as in Goethe's Romantic alternative to science. These 'alternative' epistemological realms are however the very province of the Daoist arts of China, and these arts accordingly furnish us with practices conducive to a moral consciousness of nature.

Mathews, Freya. "Community and the Ecological Self." Environmental Politics 4(Winter 1995):66. (v7,#2)

Mathews, Freya. For Love of Matter: A Contemporary Panpsychism. Albany, NY: SUNY Press, 2003. Challenges basic assumptions of Western science, modern philosophy, and environmental philosophy, arguing that the environmental crisis is a symptom of a larger, metaphysical crisis. Western science rests on the premise that the world is an inert backdrop to human presence rather than a communicative presence in its own right, one capable of dialogical congress with us. Mathews explores the transformative effects of a substitution of the latter, panpsychist premise for the former, materialist one. She suggests that to exist in a dialogical modality is to enter an expanded realm of eros in which the self and world are mutually kindled into a larger, more incandescent state of realization. She argues that any adequate philosophical response to the so-called "environmental crisis" cannot be encompassed within the minor discipline of environmental philosophy but must instead address the full range of existential questions. Freya Mathews is Senior Lecturer of Philosophy at La Trobe University. She is the author of The Ecological Self and editor of Ecology and Democracy. (v.14, #4)

Mathews, Freya. "Conservation and Self-Realization: A Deep Ecology Perspective." Environmental Ethics 10(1988):347-55. Nature in its wider cosmic sense is not at risk from human exploitation and predation. To see life on Earth as but a local manifestation of this wider, indestructible and inexhaustible nature is to shield ourselves from despair over the fate of our Earth. But to take this wide view also appears to make interventionist political action on behalf of nature--which is to say, conservation--superfluous. If we identify with nature in its widest sense, as deep ecology prescribes, then the "self-defence" argument usually advanced by deep ecologists in support of conservation appears not to work. I argue that the need for eco-activism can be reconciled with a rejection of despair within the framework of deep ecology, and that in the process of this reconciliation the meaning of the term conservation acquires a new, spiritual dimension. Mathews is in the philosophy department, University of Melbourne, Victoria, Australia. (EE)

Matthews, Sue, "The IMF and the World Bank: Financial Friends or Environmental Enemies," Africa - Environment and Wildlife 2(no. 2, January/February, 1994):27-31. In early 1993, after a hiatus of almost 30 years, the World Bank offered to lend South Africa 3 billion rand (\$ 800,000), following the new government there, and the lifting of United States and United Nations sanctions. There were detailed negotiations with the South African government and the African National Congress (ANC) party about

potential projects within a social reconstruction program. The International Monetary Fund (IMF) also offered an equally large loan to help relieve the balance-of-payments strain South Africa had experienced as a result of the drought and the consequent heavy maize imports of 1992. These advances were met with jubilation on the one hand and words of warning on the other. Many critics felt it was unwise to drive South Africa further into debt, and even unnecessary, given its huge gold reserve. When World Bank President Lewis Preston visited the country, Nedbank's chief economist was quoted, "We have enough finance in this country, but we just don't know how to use it." Others were wary of accepting the World Bank and IMF loans, having seen the consequences of the debt crisis in the rest of Africa. And since both institutions are controlled by member countries whose votes are in accordance with the size of their respective donations, the United States wields the most power. Through the bank and the IMF, the United States has exerted such a strong influence over the macroeconomic policies of African nations that it has been likened to the recolonization of Africa. Particularly troublesome are Structural Adjustment Programmes (SAF's), which typically require currency devaluation to make exports cheaper and imports more expensive, spending cuts, withdrawal of subsidies, and trade liberalization, resulting in plummeting per capita incomes, rising unemployment and urban poverty, and reduced government spending on social services, also encouraging the expansion of cash crops for export at the expense of food crops which are grown for local consumption. Much of this burden of adjustment falls on the poor, especially women and children. The World Bank and IMF have been attempting reforms, but reform is difficult. Matthews is a marine ecologist and free lance journalist.

Matzke, Jason P., A Pluralistic Humean Environmental Ethic: Dealing with the Individualism-Holism Problem, Ph.D. thesis, Michigan State University, Spring 2003. Environmental ethicists often argue for ethical holism, granting moral standing to ecosystems and species. However, this conflicts with traditional ethics which attributes moral standing to individual organisms. This is the individualism-holism problem. Marry Anne Warren and J. Baird Callicott have each offered solutions which they claim are monistic. I synthesize their views and reinterpret them as a pluralistic Humean environmental ethic, one which ameliorates but cannot fully eliminate the conflict.

Warren's principles are revised here in light of my contention that interests play the central role in determining the moral standing of individual organisms and this provides substance to Callicott's otherwise more abstract approach. Callicott's work, in turn, provides theoretical coherence for Warren's principles.

Humean sentimentalism, however, is open to the charge of relativism, especially since Hume's appeal to universal agreement on central moral beliefs cannot be sustained in a world so obviously diverse. Humean sentimentalism can be reinterpreted pluralistically. Differences in experience and culture prevent universal agreement, but the common experience of living as humans in this world, with its particularities, limits the range of acceptable alternatives. Furthermore, because reason informs sentiment, there are grounds for critically assessing Humean moral claims.

A pluralistic approach to moral reasoning provides an alternative to the continuing theoretical and practical stalemate between individualists and holists. Choices may have ethical remainders, but neither side of a debate can so easily insist that compromise threatens their moral integrity. The thesis advisor was Fred Gifford. (v.14, #4)

"My conclusion is that humanity today does indeed have a very special place in nature, not because we were divinely created to use it and rule it, but rather because we have--for what must be a fleeting moment in evolutionary time--cast off the shackles that keep population in check, and in so doing threaten, by the continuing increase in human numbers and associated activities, to bring about the end of history in the natural world. ... I believe we should cherish and conserve diversity primarily for the ethical reason that we now recognize we are no more, though no less, than a part of it; no longer can an educated person see the world as a God-given inheritance to wreak to human ends" (p.168, p. 182). May is in zoology, Oxford University. (v.10,#1)

May, Robert M., "Taxonomy as Destiny," Nature 347 (September 13, 1990):129-130 and C. H. Daugherty, A. Cree, J. M. Hay, and M. B. Thompson, "Neglected Taxonomy and Continuing Extinctions of Tuatara (Sphenodon), Nature 347 (September 13, 1990):177-179. The tuatara is a large, iguana-like reptile, the sole survivor of a group that flourished in the Triassic Period, now confined to a few islets off the coast of New Zealand. It has a well-developed third eye in the center of its head, a variation on an organ that has been reduced to the pineal gland in most vertebrates. The authors argue that there are three species, not one, and that the established view that there is one species has resulted in inadequate conservation, with one species now extinct and the others imperiled. Further, they wonder whether these two remaining species, quite disparate from superficially similar lizards, do not by some measures represent as much diversity as in all 6,000 species of more common snakes, lizards, and amphibians. Phylogenetic distance needs to be figured into estimates of diversity and into priorities in conservation. They suggest some ways to calculate this. May is a zoologist at Oxford; Daugherty, Cree, and May are biologists at Victoria University of Wellington in New Zealand; Thompson is a zoologist at the University of Sydney in Australia. (v5,#1)

Mayer, J. "The Stalemate in Food and Agricultural Research, Teaching, and Extension," Science 260: 881-82. (v6,#2)

Mayer, Sue, and Stirling, Andy, "Finding a Precautionary Approach to Technological Developments - Lessons for the Evaluation of GM Crops," Journal of Agricultural and Environmental Ethics 15(no. 1, 2002):57-71. The introduction of genetically modified (GM) crops and foods into Europe has generated considerable controversy. Despite a risk assessment system that is intended to be precautionary in nature, the decisions that have been taken have not gathered public confidence. Key attributes of a precautionary appraisal system include humility, completeness, assessing benefits and justifications, making comparisons, allowing for public participation, transparency, diversity, and the "mapping" of alternative views rather than the prescription of single solutions. A comparison of the European GM regulatory system with a different (more precautionary) approach using a "multi-criteria mapping" technique reveals a number of problems. These include the narrow framing of the established risk assessment system (thereby excluding many issues of public concern), a lack of public involvement in the process, and a failure to include appropriate comparisons or a diversity of options. Recent changes to the European regulatory system only go part of the way to addressing these issues. Further controversy may therefore be expected. However, practical ways of undertaking a more broad-based precautionary approach are now available (including the multi-criteria mapping method). These new approaches to technology assessment offer a means for decision making to earn greater public confidence in this complex and difficult area. KEY WORDS: GMO, genetically modified crops, multi-criteria mapping, precautionary principle, risk assessment. technology assessment. Mayer is with GeneWatch UK, Tideswell, Buxton, Derbyshire, UK. Stirling is with Science and Technology Policy Research, University of Sussex, Brighton, UK. (JAEE)

Mazis, Glen A., Earthbodies: Rediscovering Our Planetary Senses. Albany: State University of New York Press, 2002. Can we understand our bodies without understanding how they are part of a rhythmic flow with the rest of the planet. How can we decide how to treat the animals around us when we fail to realize the nature of our kinship with them. Without hearing the voices of the earth, rocks, and ocean waves, how can we dialogue with the planet or understand ourselves. What kind of ethics would help us find a moral way to achieve an inclusive global community and cherish the environment? Mazis is professor of humanities and philosophy at Soka University and also Associate Professor of humanities and philosophy at Penn State at Harrisburg. (v.13,#2)

Mazzotta, Marisa J. and Kline, Jeffrey, "Environmental Philosophy and the Concept of Nonuse Value," Land Economics 71 (no. 2, 1995):244-249. Economists have hotly debated nonuse values, whether they are measurable, and whether they should be included in environmental decision-making. It is important to consider the possibility that many individuals may view nonmarket valuation as irrelevant to the more fundamental issue of whether humans have obligations to nature beyond purely anthropocentric concerns. Philosophical questions are at least as important to consider as methodological questions. The debate over nonuse values can be enriched by considering different environmental philosophies. This is a challenge for economists, but if resource economists broaden their anthropocentric perspective to encompass nonanthropocentric environmental philosophies, they may find that many of the methodological problems associated with defining and measuring nonuse values will be cast in a new light. Mazzotta and Kline are in Resource Economics, University of Rhode Island, Kingston. (v.10,#1)

McAuliffe, Dennis, "Snowmobilers Could Shift Into Park Again," Washington Post (2/15/02): A3. Gatekeepers in Yellowstone wear gas masks. West Yellowstone, Montana bills itself as the "Snowmobile Capital of the World." At the entrance to the park just outside of the city, National Park employees are wearing gas masks to ward off headaches, dizziness, and nausea from the fumes of the snowmobiler entering the park. Says one gatekeeper: "It's a nightmare. It's chaos. It's loud. It's smelly. It's dangerous. . . . It's just too much. The roads can't handle it. The animals can't handle it. We can't handle it." Under the Clinton Administration, the Park Service had ordered snowmobiles phased out of Yellowstone by the winter of 2003-2004. The only vehicles that would then be allowed in the Park in the winter would be snow coaches--minivans on skis and tank-like treads--that carry 12 passengers. But after a lawsuit filed by a snowmobiler manufacturer's association, the Bush Administration has reopened the decision and is considering a compromise proposal that would allow a reduced number of snowmobiles in

the park each day and would require new stringent emissions for the vehicles. To meet these requirements, snowmobilers would have to ride new, cleaner and quieter machines with four-stroke engines instead of the two-stroke engines common today. Two-stroke snowmobiles have engines comparable in noise and emissions to law-mower motors. Four-stroke snowmobiles are quiet enough that you can talk in their presence. Some prefer them to the snow coaches, which although they reduce pollution by carrying multiple passengers, are incredibly noisy (ear plugs are provided for passengers who ride in them). After seeing the new quieter snowmobiles, some Park Service employees are saying they can live with them.

McAvoy, Leo H. and Daniel L. Dustin. "Toward Environmental Eolithism." Environmental Ethics 6(1984):161-66. We apply two contrasting principles of human workmanship, the principles of design and eolithism, to the issue of responsible environmental stewardship. Both principles are described and analyzed in an environmental context with an emphasis on the weaknesses of the more popular design principle and the strengths of the lesser known eolithic principle. We conclude with a discussion of the principles' complementary potential for environmental planning and management. McAvoy is at the Division of Recreation, Park and Leisure Studies, University of Minnesota, Minneapolis, MN. Dustin is at the department of Recreation, San Diego State University, San Diego, CA. (EE)

McAvoy, Leo H. "Hardening National Parks." Environmental Ethics 2(1980):39-44. The "tragedy of the commons" argument developed by Garrett Hardin is applied to problems associated with the increasing use of the national parks in the United States. The relevance of his argument to such problems is illustrated by a discussion of the proposals included in the recent Draft General Management Plan for Yosemite National Park. Implications for the future management of Yosemite and other public recreation resources conclude the article. McAvoy is at the Division of Recreation, Park and Leisure Studies, University of Minnesota, Minneapolis, MN.

McAvoy, Leo H. and Dustin, Daniel L., "The Right to Risk in Wilderness," Journal of Forestry 79(no. 3, 1981):150-152. Outdoor recreation opportunities ought to be expanded to include "no-rescue" wilderness areas in which users would bear sole responsibility for their personal welfare. Some wilderness enthusiasts want the challenge of being totally on their own, and they have this right. Agencies managing areas designated as full-risk would be absolved, indeed prohibited, from intervening at any time on behalf of any recreationist in distress. With comment by J. Alan Wagar.

McAvoy, Leo H., and Daniel L. Dustin. "The Decline and Fall of Quality Recreation Opportunities and Environments?" Environmental Ethics 4(1982):49-57. User satisfaction as the ultimate goal of recreation planning and management is contested by a discussion of human adaptability which makes it possible for people to adjust to a progressively lower quality of recreation opportunities without loss of satisfaction. Recreation planning and management based on such satisfaction levels are then shown to perpetuate a deterioration in the quality of recreation environments themselves. To arrest this trend, a new goal for recreation planning and management is proposed based on the equation of quality of opportunity with diversity of environmental settings. The article concludes with a discussion of this goal in light of the Recreation Opportunity Spectrum (ROS) concept developed recently by members of the United States Forest Service. McAvoy is at the Division of Recreation, Park and Leisure Studies, University of Minnesota, Minneapolis, MN. Dustin is at the department of Recreation, San Diego University, San Diego, CA. (EE)

McCloskey, H. J., Ecological Ethics and Politics. Totowa, New Jersey: Rowman and Littlefield, 1983. P. 167. This book attempts too much and ends up saying too little. Divided into three parts, it examines the scientific, ethical, and political dimensions of the environmental crisis. In Part I, McCloskey dismisses scientific predictions of ecological disaster because they are based on projections--assumptions that

present trends will continue unchanged. In Part II, McCloskey argues for a human-based ethical theory, modelled on W. D. Ross, rather than for a new ecological or nonanthropological ethic. But the position seems a muddle, for he claims (p. 36) that nonhuman natural objects can have great intrinsic value. Later, he seems to confuse intrinsic with instrumental value, for species that are ugly or harmful to man are denied the value necessary for protection (p. 61). But if human use is the criterion for protection, then there are only prudential limits on mankind's use/destruction of the natural environment. Perhaps the best part of the book is Part III, where McCloskey argues for international political solutions to the ecological crisis. Many readers, however, may find too sanguine his faith in Western liberalism. (Katz, Bibl # 1)

McCormick, Bill. "SimEve Meets OncoMouse." Real WORLD (Spring 1997): 12-13. An entertaining review of works by Donna Haraway (University of California at Santa Cruz), including her book with the unwieldy title (in cyber-jargon)

Modest*Witness@Second*Millennium.FemaleMan*Meets*OncoMouse, and her video, Donna Haraway Reads the National Geographics of Primates. After wading hip-deep in deconstruction jargon, which was inspired by Derrida and has been typified by square brackets, as in [eco]logic, whereby you can both use a word and deny it, we may now have to wade, up to our necks, in academic cyber-jargon. Or, perhaps, you can avoid stepping in. Computer-generated signifiers used by Haraway include trademark, copyright, and other signs. So Nature becomes Nature, trademarked; Earth becomes SimEarth, sim for simulated. Haraway has been praised by William Cronin in Uncommon Ground and by Michael Zimmerman in Contesting Earth's Future. Although he says he's torn between laughing and crying, McCormick, nevertheless, thinks that David Lehman's indelible phrase describes Haraway's work: it "gives bullshit a

bad name." (v8,#3)

McCormick, John. Reclaiming Paradise: The Global Environmental Movement (Bloomington: Indiana University Press, 1989, and London: Belhaven Press). A history of environmentalism on a global scale. \$ 35.00. (v1,#2)

McCormick, William, "Antoine Roquetin and 'The Adulterous Woman': Reading Sartre and Camus on Nature." Manuscript paper. Antoine Roquetin is the diarist in Nausea. Sartre thought of it as his goal "to rescue the entire [human] species from animality." He looked in the mirror one day and found out what he "had always known: I was horribly natural." "The Adulterous Woman" is one of Camus' short stories revealing an attitude toward nature. In contrast with Sartre, Camus had great respect for nature; he believed that "the earth is our common homeland," and "the body is our common bond." Copies from the author: P. O. Box 1729, Charlottesville, VA 22902-1729. (v6,#4)

McCormick, Bill. "The Island of Dr. Haraway." Environmental Ethics 22(2000):409-418. Donna Haraway's cyberfeminism has shown considerable appeal on an interdisciplinary level. Her basic premise is that by the end of the twentieth century the boundary between humans and machines has become increasingly porous, and, whether we acknowledge it or not, we are already cyborgs. She also posits this cyborg identity as an acceptable emblem for progressive politics. I disagree, and cite such writers as Susan Bordo, Sharon Ben-Tov, and Jhan Hochman to highlight some of the weaknesses of her position. I argue that we have had repeated warnings about implications of yoking the human to the machine, and that Haraway's "promising monsters" are anything but promising. (EE)

McCully, Patrick. Silenced Rivers: The Ecology and Politics of Large Dams. Atlantic Highlands, NJ: Humanities Press, Zed Books, 1996. The history and politics of dam building world wide and why large dams have become the most controversial of technologies. The wide-ranging ecological impacts of dams, the human consequences of these impacts, and the extensive technical, safety and economic problems which afflict the technology are described through numerous case studies. (v7,#1)

McCutcheon, Marc, The Beast in You: Activities and Questions to Explore Evolution. Charlotte, VT: Williamson Publishing Co., 1999. ISBN 1-885593-36-8. A book for kids, explaining the beast inside them. "Look in a mirror. What do you see? (Besides one handsome kid!) Look closely. See a beast? No, of course not. Look again. See parts of a beast? Hmm. Smile. There's one! Hold up your fingers. There's another! Wiggle your ears. There's another! Would you believe that whenever you are afraid or angry, an ancient beast springs into action? Yet it also lies quietly with you when you sleep. Sometimes the beast is warm and fuzzy. But sometimes it is as ferocious as a lion. Who is this weird creature, and why can only remnants, or parts, of it be seen? Where did the beast come from in the first place? And why has most of it disappeared?

For kids. But it could provoke useful discussion in a college class on how far humans are beasts, whether we are a part of or apart from nature, on nature and culture, and whether our beastliness is part of the problem or part of the solution. (v.13, #3)

McDaniel, Bruce A., "Economic and Social Foundations of Solar Energy," Environmental Ethics 5(1983):155-168. Solar energy is supported as an expression of certain values--such as individual freedom--and not as the satisfaction of economic preferences. (Katz, Bibl # 1)

McDaniel, Bruce A. "Economic and Social Foundations of Solar Energy." Environmental Ethics 5(1983):155-68. Underlying solar energy development is a fundamental issue of values and individual choices. Where solar energy comes to include such ideas as appropriate decentralized technology, self-sufficiency and autonomy, and a responsibility to conserve and preserve the environment, solar energy can become a channel for exploring alternative values. The requirement here is to view solar energy not as just another energy source maintaining an ever increasing flow of consumption goods. Rather, solar energy should be viewed as an opportunity for the development of values which expand individual choices through the creative process of the community paradigm. McDaniel is at the Economics department, Marquette University, Milwaukee, WI. (EE)

McDaniel, Carl N. *Wisdom for a Livable Planet: The Visionary Works of Terri Swearingen, Dave Foreman, Wes Jackson, Helena Norberg-Hodge, Werner Fornos, Herman Daly, Stephen Schneider, and David Orr*. San Antonio, TX: Trinity University Press, 2006.

Ten healing alternatives to the temptations of consumerism, including: "The world is not a global marketplace, but rather a gorgeous planet, filled with many creatures, each of whom is loved by God on its own terms and for its own sake, and each of whom contains God within. (v.13,#1)

McDaniel, Jay B., With Roots and Wings. Maryknoll, NY: Orbis Books, 1995. 243 pages. \$ 16.95, paper. Insights from the sciences, Christian theology, and interreligious dialogue break new ground in the search for wholistic spirituality. An alternative to consumerism and fundamentalism. Be open to being rooted in the earth; be open to the insights of people of other faiths. Become centered on God. (v6,#4)

McDaniel, Jay, "Physical Matter as Creative and Sentient," Environmental Ethics 5(1983):291-317. A provocative blending of quantum physics and process philosophy (Whitehead) that asks us to consider the value of "nonliving" physical matter. (Katz, Bibl # 1)

McDaniel, Jay, "Land Ethics, Animal Rights, and Process Theology." Process Studies 17 (1988): 88-102. McDaniel is primarily concerned with demonstrating the relevance of environmental philosophy for Christian "creation consciousness"---the idea that humans should care for the world as God's creation. He uses Whitehead's process theology to blend together the diverse philosophical views of animal rights, Leopold's land ethic, Heidegger, and deep ecology. (Katz, Bibl # 2)

McDaniel, Jay B., Of God and Pelicans: A Theology of Reverence for Life. Louisville: Westminster/John Knox Press, 1989. Pp. 168. In this book McDaniel argues for a life-centered ethic with a central concern for the ethical consideration of animals, rather than (as in Earth, Sky, Gods, and Mortals) an ecological vision. Influences of process thought and feminism infuse the argument. Develops from a process perspective a theological sensitivity for all living things, animal and human, especially those who suffer and are oppressed. (v1,#1) Reviewed in Environmental Ethics 13(1991):361-65. (Katz, Bibl # 2)

McDaniel, Jay B., "Communion with Spirits and Ancestors," Ecotheology No 1 (July 1996):9-34.

McDaniel, Jay. "Physical Matter as Creative and Sentient." Environmental Ethics 5(1983):291-317. With the emergence of quantum theory, the Newtonian idea that matter is inert, devoid of creativity and sentience, becomes questionable. Yet, physicists have by no means agreed upon an alternative understanding that can replace the Newtonian paradigm. Henry Stapp and others argue that Whitehead's thought provides a peculiarly appropriate framework for a new understanding of matter in light of quantum theory. The implications for a theology of ecology are manifold. No longer are matter and mind utterly discontinuous, nor is matter devoid of value until assigned value by humans or by God. Even the divine reality is, in a certain sense, "material." This calls for a new sensitivity within Western religion, in which religion itself becomes openness to, and appreciation for, physical matter. McDaniel is at the department of religion, Hendrix College, Conway, AR. (EE)

McDaniel, Jay. "Christian Spirituality as Openness toward Fellow Creatures." Environmental Ethics 8(1986):33-46. In developing theologies and spiritualities of ecology, Christians can learn from the Nobel laureate Barbara McClintock and from process theology. That "feeling for the organism" of which McClintock speaks can be understood within a process context as a distinctive mode of spirituality. The feeling is an intuitive and sympathetic apprehension of another creature in a way which mirrors God's own way of perceiving. It involves feeling the other creature as a fellow subject with intrinsic value. A subjective capacity of this sort is by no means sufficient for a spirituality of ecology, but by all means necessary. McDaniel is at the department of religion, Hendrix College, Conway, AR. (EE)

McDonald, Bryan "Considering the Nature of Wilderness: Reflections on Roderick Nash's `Wilderness and the American Mind'" Organization and Environment 14 (No. 2, June 2001) pp.188-201. This piece considers both Nash's work and the continued relevance and impact of his ideas. The objective way Nash describes wilderness as a pristine place through much of his work has become increasingly problematic as scholars consider the ways in which humans construct and reconstruct different and often contradictory conceptualizations of nature. Although Nash's work does not definitively explore the concept of wilderness and its modern significance, it does provide a foundational consideration of the way Americans have interacted with the concept of a reality not modified by human industry, culture or technology. MacDonald is a doctoral student at the School of Social Ecology, University of California at Irvine. (v.13,#2)

McDonald, David. "City Limits," Alternatives 23(no.2, 1997):28. New public-private partnerships for improving cities may not meet UN Habitat Conference expectations. (v8,#2)

McDonald, Hugh P., John Dewey and Environmental Philosophy. Albany, NY: State University of New York Press, 2004. Major figures in contemporary environmental ethics compared, contrasted with a detailed analysis of John Dewey's ethics, his theory of intrinsic value, and his holistic approach to moral justification. Arguing against the idea that Dewey's philosophy is anthropocentric, McDonald claims that using Dewey's philosophy will result in a superior framework for environmental ethics. McDonald is in philosophy at New York City College of Technology (CUNY).

McDonald, Hugh P. "Dewey's Naturalism." In the recent literature of environmental ethics, certain criticisms of pragmatism in general and Dewey in particular have been made, specifically, that certain features of pragmatism make it unsuitable as an environmental ethic. Eric Katz asserts that pragmatism is an inherently anthropocentric and subjective philosophy. Bob Pepperman Taylor argues that Dewey's naturalism in particular is anthropocentric in that it concentrates on human nature. I challenge both of these views in the context of Dewey's naturalism. I discuss his naturalism, his critique of subjectivity, his naturalization of intrinsic value, and his holistic treatment of justification. Environmental Ethics 24(2002):189-208. (EE)

McDonough, William, and Braungart, Michael, "The Next Industrial Revolution," The Atlantic Monthly, October 1998, pages 82-92. Since UNCED at Rio de Janeiro, the business buzzword has been "eco-efficiency." "Eco-efficiency is an outwardly admirable and certainly well-intended concept, but, unfortunately, it is not a strategy for success over the long term, because it does not reach deep enough. It works within the same system that caused the problem in the first place, slowing it down with moral proscriptions and punitive demands. It presents little more than an illusion of change. Relying on eco-efficiency to save the environment will in fact achieve the opposite--it will let industry finish off everything quietly, persistently, and completely" (p. 83). The authors propose instead "eco-effectiveness." "Our concept of eco-effectiveness leads to human industry that is regenerative rather than depletive. It involves the design of things that celebrate interdependence with other living systems. From

an industrial-design perspective, it means products that work within cradle-to-cradle life cycles rather than cradle-to-grave ones" (p. 88). (v.9,#4)

McFague, Sallie. Super, Natural Christians: How We Should Love Nature. Minneapolis: Augsburg Fortress, 1997. 200pp. \$15 paper. Reorienting our religious sensitivities from the "supernatural" to the "super, natural" can help us "see these earth others as we see the human others--as made in the imago dei--and therefore as both subjects in themselves and as intimations of God." McFague teaches theology at Vanderbilt Divinity School. (v8,#1)

McFague, Sally, The Body of God: An Ecological Theology. Minneapolis, MN: Fortress Press, 1993. Most accounts of religion and science address only issues pertaining to epistemology and method or offer a simple theology of the stewardship of nature. McFague wants to link the whole scientific worldview with questions of social justice, the environment, and Christian doctrines. She wants an organic model and constructs something like a liberation theology of nature. She shifts from person-centered to cosmos-centered theology. Seeing the universe as God's body impels us into an ethic of care. This is a model of God specifically for the sake of the Earth. McFague teaches theology at Vanderbilt Divinity School. Her 1987 Models of God received the American Academy of Religion's Award for Excellence. (v4,#1)

McGaa, Ed, Eagle Man, Mother Earth Spirituality: Native American Paths to Healing Ourselves and Our

World. 230 pages. \$ 14.95. San Francisco: Harper and Row, 1990. A Sioux Indian with a law degree from the University of South Dakota, also a Marine Corps veteran of over 100 combat missions in Viet Nam, argues that "a reversal of world values, a spiritual concept of the earth as God-created and sacred, is in order before we two-leggeds can be environmentally effective on a global basis." (v2,#4)

McGarigal, K; Romme, WH; Crist, M; Roworth, E; "Cumulative effects of roads and logging on landscape structure in the San Juan Mountains, Colorado (USA)," Landscape Ecology 16(no. 4, 2001):327-349. (v.13,#1)

McGarvey, Daniel J. "Merging Precaution with Sound Science under the Endangered Species Act." *BioScience* Vol. 57, no. 1 (2007): 65-70. Hypothesis tests, which aim to minimize type I errors (false positive results), are standard procedures in scientific research, but they are often inappropriate in Endangered Species Act (ESA) reviews, where the primary objective is to prevent type II errors (false negative results). Recognizing this disparity is particularly important when the best data available are sparse and therefore lack statistical power, because hypothesis tests that use data sets with low statistical power are likely to commit type II errors, thereby denying necessary protection to threatened and endangered species. Equivalence tests can alleviate this problem, and ensure that imperiled species receive the benefit of the doubt, by switching the null and alternative hypotheses. These points are illustrated by critiquing a recent review of ESA requirements for endangered fishes in Upper Klamath Lake (southern Oregon).

McGee, Glenn, "Consumers, Land, and Food: In Search of Food Ethics" in Alessandro Bonanno, ed., The Agricultural and Food Sector in the New Global Era. New Delhi: Concept Publications, 1993. McGee is with the Dept. of Philosophy, University of Massachusetts, Dartmouth, Dartmouth, MA. (v5,#2)

McGee, Glenn, "The Relevance of Foucault to Whiteheadian Environmental Ethics." Environmental Ethics 16(1994):419-424. Although he devotes little explicit analysis to ethics, Whitehead's understanding of the human moral life immerses both human moral agency and environmental ethics in the natural world, judging good actions in the context of complex and interdependent histories of value present in societies of what he calls actual occasions. In this sense, Whiteheadian environmental ethics draws on the most interesting features of Michel Foucault's genealogies of values that suffuse institutions. Nevertheless, a Whiteheadian notion of environmental ethics exceeds Foucault's work in that Whitehead acknowledges the possibility of responsible human values and actions with regard to the environment. McGee is with the Dept. of Philosophy, University of Massachusetts, Dartmouth, Dartmouth, MA. (EE)

McGinley, PC, "From Pick and Shovel to Mountaintop Removal: Environmental Injustice in the Appalachian Coalfields," Environmental Law 34(no.1, 2004):21-106. (v. 15, # 3)

McGinn, Thomas, "Ecology and Ethics," IPQ: International Philosophical Quarterly 14(1974):149-160. Humanism and anti-humanism in the ecological context. The relation of instinct and reason in value judgments. The objectivity of value. The relationship of whole and part in the ecological system. The relation of ends and means in ecological systems. Technological development and moral responsibility. "If man must respect nature as he respects his own body, a new emphasis on cooperation with natural processes must replace disruptive exploitation" (p. 159). McGinn is with the Christophers and has taught at Makerere University in Uganda.

McGinn, Thomas, "Ecology and Ethics," IPQ: International Philosophical Quarterly 14(1974):149-160. "Developed countries have an obligation to restore a disturbed balance of nature. If man must respect nature as he respects his own body, a new emphasis on cooperation with natural processes must replace disruptive exploitation. But economic and technological development looked at on a world scale raises the different problem of distributive justice. ... The ethics of ecology joined to the ethics of distributive

justice furnish the necessary guidelines for this planning. Any further destruction of the balance of nature is an attack on man and as such can be condemned on humanistic moral grounds." McGinn has taught at Makerere University in Uganda.

McGinnis, Michael V., "On the Verge of Collapse: The Columbia River System, Wild Salmon and the Northwest Power Planning Council," Natural Resources Journal 35(1995):63-92. The Columbia River Basin contains several species of endangered fish and wildlife. The Northwest Power Planning Council has attempted to restore salmon. The stakeholders are presumed to share values about the landscape, their sense of place in it, their relationship to nature, and to share faith in the ability of science and technology to restore ecosystems. Cooperation requires a high level of ecocentrism, principles of reverence, respect, humility, responsibility, care and respect--essentially an ethic of the environment. Nevertheless, the biological collapse of the salmon is at risk. But there is some hope. McGinnis is at the Center for Bioregional Studies and Conflict Resolution, Goleta, CA. (v.10,#1)

McGinnis, Michael V. "Myth, Nature, and the Bureaucratic Experience." Environmental Ethics 16(1994):425-436. From the "deep" ecological perspective, there is a dualism between an ecocentric and an anthropocentric perspective, and this dualism is reflected in the ideal of the bureaucratic experience. The bureaucrat lives by the myth of the human ability to control nature. An eco-myth is evolving that can offer one means of transcending the dominant bureaucratic mythic experience. This eco-myth moves toward a positive and sensitive human relationship with nature—a collective experience that values nature on its own terms and not as standing reserve. This position is no less mythic than the one it is replacing, but it is a better myth, because, being non-dualist, it offers the prospect of a political society in harmony with nature. McGinnis is with the Center for Bioregional Studies, Goleta, CA. (EE)

McGinnis, Michael Vincent, "Deep Ecology and the Foundations of Restoration," Inquiry 39(no. 2, June, 1996):203-217. "Throughout the globe, degraded ecosystems are in desperate need of restoration. Restoration is based on world-view and the human relationship with the natural world, our place, and the landscape. The question is, can society and its institutions shift from development and use of natural resources to ecological restoration of the natural world without a change in world-view? Some world-views lead to more destructive human behavior than others. Following Naess's ecosophical comparison of the deep and shallow ecology movements, this essay depicts the relationships between restorationists and the natural world. Contrast the anti-restoration position of Katz/Elliot. In deep ecological restoration we can develop a realization that our community is part of the self-producing character of all life. In deep ecological restoration, we find one important medium for the institutionalization, politicalization, and transpersonalization of a deeper understanding of what it means to be human being with nature." McGinnis is with the Center for Bioregional Conflict Resolution, Goleta, CA. (v8,#3)

McGlone, John J., "What is Animal Welfare?", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. A theoretical framework is developed to distinguish between acceptable and unacceptable welfare. To use this model, we can first consider a hypothetical environment that meets all known needs. If we then impose a graded stressor and take measures we could initially detect only behavioural changes. The animal would still be in a state of well-being. As the environment changes

further, the animal makes major, measurable behavioural and physiological adjustments. Still, these changes are in the range of normal homeokinetic adjustment, and are characteristic of a response to stress. Well-being is maintained, with some effort, but the animal, although not comfortable, maintains an acceptable level of well-being. These types of physiological and behavioural adjustments would also be observed among wild counterparts of the domestic species in a natural setting. Next, the animal reaches a state of environmental stress in which it would suffer health and reproductive problems if it remained in this state for a prolonged period. Even though the animal could live in this state for a long time, its well-being is lowered. The final state is a severe, acute challenge that results in death in a short time. Of course, everyone would agree the animal's welfare is poor in this final state. The question of where to draw the line between normal and poor welfare is critical. Because feeling a little poorly is much like feeling hungry (something we all normally experience from time to time), this cannot be the critical measure of well-being. Rather, only when animals reach a prepathological state (Moberg, 1985) can we say welfare is poor. Two examples are included to support the model: pain-induced immunosuppression and immunosuppression associated with depression. McGlone is in the Departments of Animal Science & Cell Biology, Texas Tech University, Lubbock, Texas 79409-2141.

McGowan, Christopher, *The Raptor and the Lamb: Predators and Prey in the Living World*. New York: Henry Holt, 1997. 235 pages. \$ 25. Predation is one of the fundamental forces driving the economy of life on Earth, and humans are fascinated by it. Studying predation offers a way to understand dynamic relations among species and to see the adaptations made in response to a dangerous world. McGowan is in zoology at the University of Toronto. (v8,#3)

McGrath, Alister, *The Reenchantment of Nature: The Denial of Religion and the Ecologic Crisis*. New York: Doubleday, 2002. Contrary to Lynn White and to the cultured despisers of religion, it is not Christianity that is the cause of the environmental crisis, but the Enlightenment secularizing of nature and exalting of human autonomy. Belief in the Christian God brings with it a profound sense of human limits with regard to nature and a thoroughgoing respect for and wonder at nature, a reenchantment of nature for which many, especially exponents of the Romantic tradition as Wordsworth and Thoreau, have long been searching. McGrath devotes much less time to the anti-nature elements within Christianity, or to the ambiguous understandings of nature as being both good and fallen. McGrath is professor of historical theology, Wycliffe Hall, Oxford.

McIntosh, Alastair, Soil and Soul: People versus Corporate Power. London: Aurum Press, 2001. A radical politics of place, with much attention to the Hebrides of Scotland. Earth, or soil in a metaphorical sense, and people, or metaphorically, soul. The interrelationships between natural ecology, social community, and the human spirit. Engagement with soil and soil transforms into a vision of freedom and social justice. A radical liberation theology, rediscovering both the presence of God in nature and the neglected femininity of divine wisdom. Two successful campaigns at community empowerment: land reform on the Isle of Eigg and in the new Scottish Parliament. How the people of the Isle of Harris resisted their mountain being turned into the gravel pit of Europe by a multinational road-stone company. The world can be reconstituted; we can all assume responsibility for our lives and for the planet. A call to "make beauty blossom anew out of desecration". (v.13,#4)

McIntosh, Alastair, "The Emperor has no Clothes ... Let us Paint our Loincloths Rainbow: A Classical and Feminist Critique of Contemporary Science Policy," Environmental Values 5(1996):3-30. The British government's White Paper on science together with government research council reports are used as a basis for critiquing current science policy and its intensifying orientation, British and worldwide, towards industrial and military development. The critique draws particularly on Plato and Bacon as yardsticks to address who science is for, what values it honours and where current policy departs from imperatives of socio-ecological justice. Metaphors of the Emperor's New Clothes and incremental spectral shift in attitude help illuminate both the problems and ways forward. The paper calls for a re-integration of classical perspectives with added insights, often ecofeminist, from philosophy, poetics and a theology of reverence. Predication on the values of love, interconnectedness and orientation towards children's all-round development should be central to curricular reform. Consistent with the views of Plato, the original founder of the Academy, the utilitarian role of science ought to be balanced with a contemplative role of science as the art of knowing ourselves in relation to nature. Only with such a holistic academic approach can it adequately rise to providing a pedagogy of authentic human development, service to the poor and remedies, rather than contribution, to the ongoing destruction of nature. KEYWORDS: Philosophy of science, ecophilosophy, ecofeminism, ecotheology, human ecology, geopoetics, reverence, deep ecology, environmental education, science policy, Plato, Bacon. (EV)

McKay, Christopher P. and Robert H. Haynes, "Should We Implant Life on Mars?" Scientific American, December 1990. "Traditional theories of value are based on two ingrained habits of human thought: anthropocentrism and geocentrism. Principles of ethics have been formulated primarily to guide and govern the relations among people here on Earth. The scope of ethical theory has recently been expanded, however, to encompass all forms of nonhuman life, ecosystems and even inanimate structures, such as rocks, landforms and barren planets. This radical environmental ethic includes the idea that Earth's rich and diverse biota is inherently good. Thus, the biosphere as we know it is by definition what these theories assert ought to be." Turning to the solar system, "ecopoiesis" is "the fabrication of a self-sustaining ecosystem on a lifeless planet." "Clearly, ecopoiesis raises philosophical issues that can be resolved only by adopting a cosmocentric theory of intrinsic values." "If and only if no potentially viable forms of life are found should we attempt to introduce emigrant species from Earth." McKay is a research scientist with NASA in California and Haynes is distinguished research professor of biology at York University, Toronto. NASA has just launched an eight-year "Search for Extraterrestrial Intelligence--Microwave Observing Project (SETI-MOP)" that will scan 10 billion times more search space than the sum of all previous searches. (v1,#4)

McKean, Andrew, "Manhunters," Outdoor Life 213 (no. 3, March 2006): 52-57. Wolves killed Kenton Carnegie, a college student on a short-term contract to survey mineral deposits in northern Saskatchewan in November 2005, in what looks like a clear case of wolf predation on humans. This is the first documented wolf-caused fatality of a human in North America in at least 100 years and perhaps the first ever on this continent. There are, however, some 80 incidents of wolves attacking or injuring people, without fatality. A frequent issue in such incidents is whether the wolves had been harassed, not an issue here. However, these wolves were quite habituated to people, living around mine site camps and their dumps, and some say that the wolves were living in a quite unnatural condition and had become more like junkyard dogs. Dogs in North America kill about twenty people a year.

McKean, J., Johnson, D., Johnson, R. and Garth Taylor, R., "Can Superior Natural Amenities Create High Quality Employment Opportunities? The Case of Nonconsumptive River Recreation in Central Idaho," Society and Natural Resources 18(no. 8, September 2005): 749-758.

McKenny, Gerald P., To Relieve the Human Condition: Bioethics, Technology, and the Body. Albany, NY: State University of New York Press, 1998. In contrast to the utopian quest of medicine for perfect health, with the human body brought under our choices and desires, McKenny argues that the task of bioethics is to explore the moral significance of the body as it is expressed in the discourse and practice of moral and religious traditions. McKenny is in religious studies at Rice University. (v8,#3)

McKibben, Bill, The End of Nature. Now released in paperback, Anchor, 1990, \$ 9.95. (v1,#4)

McKibben, Bill, Maybe One: A Personal and Environmental Argument for Single-Child Families. New York: Simon and Schuster, 1998. 240 pages. Summarized in "The Case for Single-Child Families," Christian Century, May 13, 1998, vol. 115, pp. 498-504. A sensitive study of the pros and cons of having one child instead of two, or three, with saving the environment in mind. In some senses this can seem concerned and selfless, though from other perspectives, one has to take seriously those who think having no children, or one, is selfish, since such parents often wish to do more self-fulfilling things with themselves than to bother with children. "My hope is not to settle this question for anyone else; it truly isn't my business what you chose to do. All I want to do is to open the debate, to remove 'population' from the category of abstraction and make it the very real consideration of how many children you or I decide to bear. No single decision any of us will make will mean as much to our own lives or to the life of the planet."

"The beginning of Genesis contains the fateful command ... to 'be fruitful and multiply, and fill the earth.' That this was the first commandment gave it special priority. And it was biological, too, a command that echoed what our genes already shouted. But there is something else unique about it--it is the first commandment we have fulfilled. ... We can check this commandment off the list. ... But when you check something off a list, you don't throw the list away. You look further down the list and see what comes next. ... Feed the hungry, clothe the naked, comfort the oppressed, love your neighbor as yourself; heal the earth." McKibben, author of The End of Nature, is Sunday School superintendent at a Methodist Church in upstate New York. He and his wife have one child.

McKibben, Bill, The Age of Missing Information. New York: Random House, 1992. 261 pages. \$ 20.50. McKibben conducted an experiment. On May 3, 1990 he had the entire output of the United States' largest cable TV system taped, almost 100 channels. McKibben analyzed the films, programs, news, commercials to discover the nature of electronic media and how it reduces the sort of information we receive. This analysis is compared with the information presented to him on an overnight stay in the Adirondack Mountains. The ecological crisis is grounded in an inability to relate to the natural world, and this is compounded by the media. What habits of mind and body do TV ads and jingles help produce? Sloppy habits, where we cease to be mindful of how we are connected to a finite Earth. McKibben (like Gore) analyzes this as, at depth, a spiritual problem. (v3,#4)

McKibben, Bill, The Comforting Whirlwind: God, Job, and the Scale of Creation. Grand Rapids, MI: Wm. B. Eerdmans Publishing Co., 1994. Paper, \$ 8.99. McKibben, author of The End of Nature, here undertakes an environmentalist reading of the book of Job. (v5,#4)

McKibben, Bill, The End of Nature. New York: Random House, 1989. Pp. ix, 226. Originally a lengthy magazine article for The New Yorker, this is a highly readable and significant merging of scientific, religious, philosophical, and political thought concerning the environmental crisis. McKibben begins with the scientific fact that humanity has altered the atmosphere, and thus the climate of the earth. Nothing, therefore, exists in the world untouched by human technology; the idea of a pure, unspoiled nature, existing somehow apart from human civilization, is an impossible contradiction. McKibben explores the meaning of this end of nature, particularly for religious and philosophical conceptions of humanity. The end of the book involves a tour through two opposing philosophical visions, continued domination of nature and resistance to human-centeredness. As a work of journalism, this book has no

documentation--there are no footnotes despite many references to other books and thinkers. Nonetheless, it is a poignant and moving introduction to the problems of environmental philosophy. (Katz, Bibl # 2)

McKibben, Bill, "Climate Change and the Unraveling of Creation," Christian Century 116 (no. 34, Dec. 8, 1999):1196-1199. "In the past 30 years we have systematically and even more rapidly destroyed this planet's inventory of life. ... In the case of the struggle to save and preserve the environment--God's creation--the church's leadership is absolutely mandatory." McKibben is the author of The End of Nature and Maybe One, recently reissued by Penguin. (v10,#4)

McKibben, Bill, "Creation Unplugged," Religion and Values in Public Life, vol. 4, no. 2/3, Winter/Spring 1996. The Center for the Study of Values in Public Life at Harvard Divinity School. A supplement to the Harvard Divinity Bulletin, vol 25, no. 2/3, 1996. "If we are not to wreck God's creation, then there are certain things we simply must not do--we simply must not continue consuming as we are now. And there are certain things we must do--we must share our bounty with the rest of the world, finding somewhere a middle ground so they don't follow our path to consumer development" (p. 20). McKibben is the author of The End of Nature and Hope, Human and Wild: True Stories of Living Gently on the Earth; and lives in the Adirondacks. (v7,#2)

McKibben, Bill, Hope, Human and Wild. Little, Brown, 1995. \$ 22.95. After The End of Nature, McKibben now finds hope for our beleaguered Earth. Hope begins when he notices the remarkable recovery of forest and wildlife in the Adirondacks around his home, even though the area had been a barren, overlogged wasteland only a hundred years ago. This sent him on a quest for other signs of hope, found as far off as Brazil and India. (v6,#4)

McKibben, Bill, Enough: Staying Human in an Engineered Age. New York: Times Books (Henry Holt), 2003. First the "end of nature," and next "the end of humans." An assessment from the frontiers of bioscience and robotics of how these developments are both rapidly maturing and veering inexorably out of control. McKibben applauds genetic engineering when linked with therapy, for in this case we do not tamper with the fundamental genetic materials passed to future generations in the germline. But genetic engineering is likely also to be used to enhance height, intelligence, athletic ability, or just about any trait imaginable. Parents will choose the genes that shape their children's future; a child will become a pianist because that's what his parents choose for him, not because he chose it. If we can reshape our bodies to overcome any setbacks we encounter, life is meaningless because you can never know how you would really feel, if your body were not pumping designer proteins. This starts us on the road to leaving human nature behind, engineering ourselves into a "posthumanity." The genetic engineering and nanotechnology future crosses the line beyond "enough" into the zone of "way too much." There is a spiritual boundary, "the enough point."

McKibben, Bill, *Wandering Home: A Long Walk Across America's Most Hopeful Landscape: Vermont's Champaign Valley and New York's Adirondacks*. New York: Crown (Random House), 2005. McKibben takes a journey between the two homes he owns, from the first in Ripton, Vermont, where he lives now, to the second in the Adirondack town of Johnsburg, where he spent the better part of his adult life. The two homes are about seventy miles apart, but the meandering route he takes becomes a few hundred miles. He finds the landscape physically rich; and the region with its pockets of communities endeavoring to live intentionally and sustainably offers the promise of "graceful inhabitation, for working out the answers that the planet is posing in this age of ecological pinch and social fray." He comes across one newly built house "four times too large for any conceivable purpose," and worries "that the scale of this region--herb farms, piano teaching, general stores, little libraries--coexist[s] uneasily with the high-octane national economy."

McKibben, Bill, "A Deeper Shade of Green," National Geographic, August 2006. Ideas for a new, cultural environmentalism. "Humans have never faced a civilization-scale challenge before. Whether we deal with it gracefully or not depends, I believe, on what happens to that creed we call environmentalism." The original environmentalism, saving remnants of wild nature, was impressively successful, "but when it came to deal with global warming, this kind of environmentalism flunked." People desire growth and that depends on fossil fuel consumption; we must address the issue of intelligent growth that builds on "people's aspirations for good and secure and durable lives." "We would need a new kind of cultural environmentalism that asks deeper questions than we're used to asking." McKibben lives in a Vermont valley, working out this new cultural environmentalism, and wondering whether it means The End of Nature.

McKibben, Bill, "The Emotional Core of The End of Nature" accompanies a symposium on McKibben's *The End of Nature*, Organization and Environment 18 (no 2, June 2005).

McKinley, Jr., James C., "With Help, Sea Turtles Rally to Escape Oblivion," New York Times, October 14, 2004, A1, A12. Olive ridley sea turtles are recovering in Mexico, although the other six species of sea turtles are not doing well. Hundreds of thousands of ridley sea turtles now come ashore in Mexico to nest, recovering since the 1980's, with this year's landing one of the largest in recent memory. But the turtles and their nests have to be guarded at gunpoint against poachers, who kill the turtles and sell the eggs as a delicacy in Mexican markets. (v.14, #4)

McKinney, William J. and H. Hamner Hill. "Of Sustainability and Precaution: The Logical, Epistemological, and Moral Problems of the Precautionary Principle and Their Implications for Sustainable Development." Ethics and the Environment 5(2000):77-88. ABSTRACT: From the convening of the Brundtland Commission in 1983 to the United Nations Conference on Environment and Development and beyond, sustainable development has been one of the core issues facing environmental ethicists and policy makers. The challenge facing both policy makers and ethicists has been to ascertain the proper formulation and implementation of sustainable development practices either within the present global market economy or within a new, more ecological, paradigm. This analysis, however, takes a slightly different tack. (E&E)

McLaughlin, A., "Is Science Successful? An Ecological View." Philosophical Inquiry 6, no. 1 (Winter 1984): 39-46. McLaughlin uses the metaphor of an organism as part of a net to show why we believe science to be successful and why at the same time it is not--i.e., why it is leading into an ecological crisis (see also McLaughlin's article in Environmental Ethics 7 [Winter 1985). (Katz, Bibl # 1)

McLaughlin, Andrew, "Images and Ethics of Nature," Environmental Ethics 7(1985):293-320. This is a further development of a paper on science and ecology. Here McLaughlin discusses the way different world-views construct an image of nature, and consequently, an ethics of nature. Science is merely

instrumental, and so nature is not respected. But alternative views of nature, primarily the image of an interconnected web, can be derived from ecological principles and Buddhism. (Katz, Bibl # 1)

McLaughlin, Andrew, Regarding Nature: Industrialism and Deep Ecology. Albany, NY: State University of New York Press, 1993. Deep ecology explained and demystified for a general readership by drawing out areas of continuity and discontinuity between deep ecology and progressive political thought. The fundamental assumptions of the ideologies within which we find ourselves caught--capitalism, socialism, anthropocentrism, egocentrism. McLaughlin is professor of philosophy, Herbert H. Lehman College, City University of New York. (v4,#1)

McLaughlin, Andrew, "Marxism and the Mastery of Nature: An Ecological Critique," in Roger S. Gottlieb, ed., Radical Philosophy: Tradition, Counter-Tradition, Politics (Philadelphia: Temple University Press, 1993) Within the Marxist tradition, industrialism and the domination of nature have largely been endorsed as a potentially progressive expansion of human power and the avenue toward the historical realization of human freedom. But any dialectical project that acknowledges the embeddedness of humanity within nature should be skeptical of the project of the domination of nature. The Marxist project of domination is incompatible with a dialectical understanding of society and nature. McLaughlin is a philosopher at Lehman college in the Bronx, New York. (v5,#1)

McLaughlin, Andrew, "Ecology, Capitalism, and Socialism." Socialism and Democracy (Spring/Summer 1990): 69-102. Excellent overview of the failures of both capitalism and socialism (in its current forms) to deal with ecological problems. Capitalism fails for three fundamental reasons: the dynamics of markets, the discounting of the future, and the requirement of non-sustainable growth. Centralized socialism fails because "bureaucratic rationality" is unable "to achieve an ecologically adequate society" (p. 91), primarily because of inadequate knowledge of the manipulation of environments. A socialism tied to bioregions, democratic and decentralized, is the best possible solution. (Katz, Bibl # 2)

McLaughlin, Andrew, "Ecology, Capitalism, and Socialism" Socialism and Democracy Spring/Summer 1990. There are theoretical and practical difficulties matching capitalism with an ecologically sound human society or with adequate respect for nature. Socialism has more promise theoretically, but existing socialist societies are often no better in practice than capitalist ones. The centralized Soviet bureaucracy is a major problem. Bioregional (green) socialism could be an answer. Useful survey of the Soviet debate about nature preserves. (v1,#2)

McLaughlin, Andrew. "Images and Ethics of Nature." Environmental Ethics 7(1985):293-319. Science generates an image of nature as devoid of meaning or value, and this image makes moral limits on the human manipulation of nature appear irrational. In part this results from the particular kind of abstraction that constitutes scientific activity. For both epistemological and practical reasons this abstraction should not be taken as the only reality of nature. Such mis-taking becomes increasingly likely--and dangerous--as science and technology are used in the construction of the world within which we experience nature and ourselves. Three alternative images of nature are discussed to indicate other possibilities. Imaging nature as an interconnected network, a view rooted in both ecology and Buddhism, is a more comprehensive and adequate foundation for conceptualizing the practical and ethical dimensions of humanity's relation with nature. McLaughlin is in the philosophy department, Lehman College, City University of New York, Bronx, NY. (EE)

McLean, Douglas, and Peter G. Brown, eds., Energy and the Future. Totowa, New Jersey: Rowan and Littlefield, 1983. Pp. 206. This is a collection of essays written under the auspices of the Center for Philosophy and Public Policy, University of Maryland. It is interdisciplinary; the main philosophical interest lies in the arguments regarding ethical obligations to future generations. Several perspectives are proposed: In two separate papers, Brian Barry, "Intergenerational Justice in Energy Policy," (pp. 15-30), and Talbot Page, "Intergenerational Justice as Opportunity," (pp. 38-58), argue that justice demands the preservation, not of resources, but of opportunities for the use of resources and the creation of the good life. David A. J. Richards, "Contractarian Theory, Intergenerational Justice, and Energy Policy" (pp.131--150), attempts to use the idea of Rawls' "original position" as a model for intergenerational justice. Hillel Steiner, "The Rights of Future Generations," (pp. 151-165), attacks the notion that nonexistent entities can have rights now and uses this critique to undermine the currently fashionable Lockean/Nozick view of property rights regarding natural resources. Douglas MacLean, "A Moral Requirement for Energy Policies," (pp. 180-197) argues that concern for the future is a moral value promoting the good life--it is not a contingent concern of human interest or preference. But the central essay in this collection is Derek Parfit's "Energy Policy and the Further Future: The Identity Problem" (pp. 166-179). I consider this essay, along with Parfit's "Future Generations: Further Problems," Philosophy and Public Affairs 11 (1982): 113-172, to be the most important theoretical work in the ethics of future generations. Parfit's problem is simple: any policy we contemporary people adopt will change the identities of the people who actually exist in the future: thus, our obligations regarding the future cannot be directed at future people. Nevertheless, Parfit still wants to claim that it is better for us to create a good world for the future. But for whom is it better? Not the people who exist because of the policy, and not the people who would have existed if we had adopted a different policy. Parfit's position amounts to this principle: "It is bad if those who live are worse off than those who might have lived." (p. 75). But he admits that this principle is, at present, unjustified. No argument concerning the obligations to future generations can avoid Parfit's paradox; but a solution to it will likely lead to a redrawing of the map of ethical principles (see pp. 176-178, "Theoretical Footnote"). (Parfit's work has produced a vast bibliography in its own right, and I do not list any of these works here. See, e.g., Ethics 96, no. 4 [1986], a Symposium on Derek Parfit's Reasons and Persons [Oxford University Press, 1984].)

McManus, Reed. "Green & Greed: Can They Get Along?" *Sierra* Vol. 91, no. 1 (January/February 2008): 26-33. McManus audits the merger of business and the environment. For those who think environmental problems need a host of piecemeal solutions, cumulating into overall effectiveness, this is a useful summary of what business is doing to go green and typically also to save money: better packaging, energy savings, offsetting emissions, fair-trade certified crops, and hybrid vehicles. Wal-mart gives better placement in stores for products that have addressed sustainability issues. Wal-mart used research by energy consultant Amory Lovins to improve fuel efficiency by 25%, partly by installing generators in its fleet of trucks so that parked drivers don't need to run their engines to get air conditioning. Dell Computer plans for its entire operation to be carbon neutral this year.

McMichael, Anthony J., Planetary Overload: Global Change and the Health of the Human Species. New York: Cambridge University Press, 1993. 352 pages. An analysis of the ways in which global change is affecting human health adversely. (v6,#2)

McMichael, Tony, Human Frontiers, Environments and Disease: Past Patterns, Uncertain Futures. Cambridge, UK: Cambridge University Press, 2001. Epidemiology and environments, past and future. The dilemma is that stressed environments promote disease epidemics. Most of the world lives at a level of privation Westerners would not accept, beyond the reach of the very resources Westerners cannot live without. The worsening dilemma is that to the extent that Westerners support their development in, and extension of their prosperity to, the rest of the world, they sow the seeds of everyone's destruction. There may already be too many people in the world to support universal living standards at a level Westerners consider minimal. There isn't enough land, enough water, or enough resources. In a zero sum game, reality trumps altruism; the price of comfort for some being the misery of others, including their epidemic diseases, which may also become ours. (v.13,#1)

McMillion, Scott, "Cattle-killing Wolf Pack in for Shock," Bozeman Daily Chronicle (5/18/00): A1. Yellowstone wolves being trained to avoid cattle. Members of the Sheep Mountain wolf pack, one of about a dozen packs of restored wolves in Yellowstone area, are being captured, placed in a pen, and fitted with shock collars that will activate whenever they get within two meters of a calf placed in the pen with them. The pack has been killing cattle for several years and past attempts to modify their behavior (by killing members known to have eaten cattle) have failed. The plan is to train the wolves for several months so they realize "that livestock aren't prey items" and then release them back into their home territory. The hope is that these wolves will learn to avoid livestock and will teach their offspring to do the same. Ed Bangs, the leader of the wolf-restoration effort in the region, thinks "the only alternative is to shoot them all." But then a new pack would probably take over the territory that includes both private

and public grazing land bordering the Park and they too would probably begin to prey on cattle. (v.11, #2)

McMillion, Scott, "Cherry Creek Poisoning Plan OK'd," Bozeman Daily Chronicle (7/24/98): 3. Poisoning three species of trout to assist an endangered trout. In order to provide habitat for West slope cutthroat trout, the Gallatin National Forest in Montana plans to remove brook, rainbow, and Yellowstone cutthroat trout from Cherry Lake in the Lee Metcalf Wilderness by poisoning the lake and its tributaries. The West slope cutthroats are candidates for listing under the Endangered Species Act. Because a waterfall kept any fish from reaching upstream on their own, the drainage was barren of trout until people introduced the fish earlier this century. Thus none of these species of fish are "native to this habitat," though one might argue that 50 to 80 years is sufficient for the introduced fish to become "naturalized." Ironically, about 100 miles away, National Park Service officials are trying to protect the Yellowstone cutthroat by killing Midwestern lake trout, a species that was introduced into Yellowstone Lake. McNally, Ruth, Wheale, Peter. "Biopatenting and Biodiversity: Comparative Advantages in the New Global Order", The Ecologist 26(no.5, 1996):222. Genetic engineering has enabled novel species of plants, animals, and micro-organisms to be created as genes from totally unrelated species, which cannot breed with each other so are spliced together. To reap financial gain, the biotechnology industry has, over the past two decades, pushed for patent law to cover its "inventions". Patent rights over living organisms, combined with the industry's efforts to gain exclusive access to the world's biodiversity, are exacerbating the commodification and industrialized use of species. Opposition to this "biotechnological imperialism" is gaining momentum. (v7,#4)

McNally, Ruth and Peter Wheale, "Biopatenting and Biodiversity: Comparative Advantages in the New Global Order," The Ecologist 26 (no. 5, Sept.-Oct, 1996):222-228. Over the last two decades, the biosciences industry has been stretching the interpretation of patent law in order to attain intellectual property rights over genetically engineered living organisms. Such patent rights, coupled with moves to gain exclusive access to the biodiversity of the South, are leading to a new global order. Opposition to such "biotechnological imperialism" is gaining in momentum. McNally is in human sciences at Brunel University. Wheale is with the University of Surrey's European Management School. McNeil, Jr., Donald G., "The Great Ape Massacre," New York Times Magazine, May 9, 1999, Section 6, pages 54-57. The bushmeat crisis in Africa.

Further information: On 19 February 1999, 34 experts, representing 28 different organizations and agencies, assembled at the offices of the American Zoo and Aquarium Association (AZA) in Silver Spring, Maryland in a consensus statement expressed alarm at the commercial bushmeat crisis in Africa and its impact on threatened and endangered species, particularly great apes. The bushmeat trade is having dire consequences, not only for wildlife, but also for people in Africa and throughout the world. If current unsustainable rates of exploitation continue, the commercial bushmeat trade will decimate, if not eliminate, some endangered species, such as great apes, forest elephants, and other fauna upon which the health of forest ecosystems depend. It may have already caused the extinction of Miss Waldron's red colobus monkey, which formerly existed in the forested zones of Ivory Coast and Ghana. The African great apes--chimpanzees, gorillas, and bonobos--are at particular risk. This illegal trade is destroying free-ranging populations of chimpanzees just when their protection in the wild is being recognized as important for understanding how to control the spread of HIV and other emerging infectious diseases in humans. Moreover, the killing and dressing of chimpanzee meat in the bush may present a human health risk for those engaged in this trade and is a potential point of entry for new diseases into the global human population.

African governments are called to take full responsibility for enforcing existing laws and maintaining vigilance against corruption, and until policy makers put the value of protecting wildlife ahead of immediate financial gain, there will be no way to stem the loss of Africa's irreplaceable biological heritage, including our closest living relatives, the great apes. Logging companies, mining firms, and other extractive industries bear a significant responsibility for the growth of the unregulated

commercial bushmeat trade. They must ensure that illegal hunting of threatened and endangered species is prohibited in their concessions and minimize their impact on wildlife by providing alternative sources of food for their employees. They should also do all they can to contribute to equitable, transparent, and lasting solutions. McNeil, Jr., Donald G., "Kosher Authority Seeks Change in Steer Killings," New York Times, December 3, 2004, p. A 17. In the wake of accusations of cruelty from People for the Protection of Animals (PETA), the world's largest kosher certification authority has asked a major kosher slaughterhouse in Iowa (AgriProcessors Inc.) to change the way it kills animals. The plant is the U.S. largest producer of meat that is glatt kosher, the highest standard of cleanliness. It is also the only American plant allowed to export to Israel. Israel's chief rabbinate has also said that it will no longer accept meat from the plant, unless practices are changed. PETA managed clandestine videotaping of killings in the plant showing workers cutting the throats out of living steers and then dumping the animals on the floor where they thrashed and bellowed while bleeding to death.

The presenter draws on experience in rural church and community, noting changes since the mid twentieth century and exploring issues of theory versus practice and secular versus religious. Some anecdotal evidence for incipient ecotheology is offered, with reference to perceptions of relationship with the land, and popular theology in Bible texts and hymns. The aim is to counter claims that New Zealand agriculture is devoid of ecotheological foundation, but also to affirm the positive in actual thought and practice of rural people and raise questions about what is still missing. Case studies - sustainable logging, the dairy mega-merger and genetic modification - set the scene for a gospel commission for Church and academy to spread our ecotheological vision. The presentation culminates with the point and purpose of all faith and practice - indeed the crown of creation itself - the sabbath.

McQuillan, Alan G. "Passion and Instrumentality: Further Thoughts on the Callicott-Norton Debate." Environmental Ethics 20(1998):317-24. Although J. Baird Callicott and Bryan G. Norton define the word intrinsic quite differently, both are against any "essentialist" position which posits "an objectivist theory of value in nature." Viewed in this context, their differences emerge in terms of instrumentality and anthropocentrism. While a nonanthropocentrist position is tenable, it cannot be divorced from the centrality of human passion and desire. From the Humean perspective, assumed by both authors, however, desire does not reduce to instrumental value alone. As a result, Callicott's position emerges as the stronger argument: that the moral consideration of nature requires more than instrumental value, no matter how broadly instrumentality is construed. MacQuillan is in the School of Forestry, University of Montana. (EE)

McQuillan, Alan G., "Is National Forest Planning Incompatible with a Land Ethic?" Journal of Forestry, May 1990. "The forestry profession has not developed an acceptable methodology for allocating forest land among often mutually exclusive uses." "The question about which lands are suitable for timber production is not one that the profession is well-prepared to answer." The Forest Service "determines what lands to allocate to timber harvest on the basis of whether they are needed to meet timber production targets established for each forest rather than on the basis of the forest lands' inherent productive potential. These targets may be passed down to the forest level or on the basis of local timber production goals set to meet the needs of existing or projected milling capacity in or near each national forest. Either way, by allowing output targets to drive the land allocation process, Forest Service planners can avoid the more difficult question of whether road building and timber harvesting represent the highest and best use of any particular ground in the forest." "It is hardly surprising that the agency tends toward schizophrenia." McQuillan is director of the Wilderness Institute, University of Montana, Missoula. (v1,#4)

McQuillan, Alan G., "Cabbages and Kings: The Ethics and Aesthetics of New Forestry." Environmental Values Vol.2 No.3(1993):191-222. ABSTRACT: The advent of new forestry in the United States represents a traumatic shift in the philosophy of national forestry praxis, a broadening of values to include aesthetics and sustainability of natural ecological process. The ethics of traditional forestry are shown to be 'Stoic utilitarian' and positivist, while the ethics of new forestry adhere closely to the 'land ethic' of Aldo Leopold. Aesthetics in traditional forestry are shown to be modernist, and to have developed from, and in opposition to a Romantic aesthetic of the late nineteenth century. This transition is traced from the first U.S. landscape architect, Frederick Law Olmsted Sr., to the first U.S.-born forester, Gifford Pinchot. The language and precepts of new forestry are shown to parallel those of postmodernism, and the possibility of a broadened aesthetics of forestry, developed through postmodernist criticism, is outlined. The language of gardening is used as a model of forestry praxis, with traditional forestry adhering to the principles of vegetable gardening, while new forestry offers an opportunity to flesh out an entire spectrum of gardening genres. KEYWORDS: Environmental ethics, aesthetics, forestry, forest policy, postmodernism. School of Forestry, University of Montana, Missoula, MT 59812, USA.

"Can forest planning adhere in principle to Leopold's land ethic and juggle multiple uses in practice?" "The question about which lands are suitable for timber production is not one that the professional is well-prepared to answer." "It is hardly surprising that the agency [U. S. Forest Service] tends toward schizophrenia." McQuillan is director of the Wilderness Institute and a professor at the University of Montana, Missoula. (v2,#1)

McShane, Katie, The Nature of Value: Environmentalist Challenges to Moral Theories, Ph.D. thesis, University of Michigan, Ann Arbor. 2002. Environmentalists have argued that contemporary ethical theories have overly strict rules about what kinds of things can be intrinsically valuable. These rules make it impossible for many of the things that environmentalists care deeply about to be considered bearers of intrinsic value--things which are not rational, sentient, or in some cases, even alive. In this dissertation I consider possible responses to this environmentalist criticism from within mainstream ethical theories. Using the value of ecosystems as a test case, I analyze what features a thing must have, and why, in order to be a (potential) possessor of intrinsic value on each of three ethical theories: wellbeing-based, Moorean, and rational attitude accounts. Ultimately, I argue that while a place can be made for the intrinsic value of ecosystems on all three theories, rational attitude accounts do the best job of accommodating environmentalist concerns without incurring other significant theoretical costs. McShane is in philosophy at North Carolina State University, but this year a visiting professor at the Center for Ethics and the Professions at the Kennedy School, Harvard University. Her committee was: Elizabeth Anderson (chair), Stephen Darwall, P. J. Ivanhoe, John Vandermeer (Biology).

McShane, Katie, "Anthropocentrism vs. Nonanthropocentrism: Why Should We Care?" *Environmental Values* 16(2007): 169-186. Many recent critical discussions of anthropocentrism have focused on Bryan Norton's 'convergence hypothesis': the claim that both anthropocentric and nonanthropocentric ethics will recommend the same environmentally responsible behaviours and policies. I argue that even if we grant the truth of Norton's convergence hypothesis, there are still good reasons to worry about anthropocentric ethics. Ethics legitimately raises questions about how to feel, not just about which actions to take or which policies to adopt. From the point of view of norms for feeling, anthropocentrism has very different practical implications from nonanthropocentrism; it undermines some of the common attitudes - love, respect, awe - that people think it appropriate to take toward the natural world. McShane is in philosophy, North Carolina State University.

McShane, Katie, "Convergence, Noninstrumental Value and the Semantics of 'Love': Reply to Norton," *Environmental Values* 17(2008): 15-22. Bryan Norton argues that my recent critique of anthropocentrism presupposes J. Baird Callicott's philosophically problematic distinction between intrinsic and instrumental value and that the problems that it raises for anthropocentrism in general are in fact only problems for strong anthropocentrism. I argue, first, that my own view does not presuppose Callicott's distinction, nor any claims about instrumental value, and second, that the problems it raises for anthropocentrism apply to weak and strong anthropocentrism alike

McShane, Katie. "Ecosystem Health." *Environmental Ethics* 26(2004):227-245. On most understandings of what an ecosystem is, it is a kind of thing that can be literally, not just metaphorically, healthy or unhealthy. Health is best understood as a kind of well-being; a thing's health is a matter of retaining those structures and functions that are good for it. While it is true both that what's good for an ecosystem depends on how we define the system and that how we define the system depends on our interests, these facts do not force us to the conclusion that an ecosystem has no good of its own. Ecosystems and persons can have goods of their own in spite of the fact that the schemes we use to categorize them are matters that we decide upon. (EE)

McShane, Katie. Review of *Morality's Progress: Essays on Humans, Other Animals, and the Rest of Nature*. By Dale Jamieson. *Environmental Ethics* 28(2006):323-326. (EE)

McShane, Katie. "Why Environmental Ethics Shouldn't Give Up on Intrinsic Value." *Environmental Ethics* 29(2007):43-61. Recent critics (Andrew Light, Bryan Norton, Anthony Weston, and Bruce Morito, among others) have argued that we should give up talk of intrinsic value in general and that of nature in particular. While earlier theorists might have overestimated the importance of intrinsic value, these recent critics underestimate its importance. Claims about a thing's intrinsic value are claims about the distinctive

way in which we have reason to care about that thing. If we understand intrinsic value in this manner, we can capture the core claims that environmentalists want to make about nature while avoiding the worries raised by contemporary critics. Since the distinction between intrinsic and extrinsic value plays a critical role in our understanding of the different ways that we do and should care about things, moral psychology, ethical theory in general, and environmental ethics in particular shouldn't give up on the concept of intrinsic value. Keynote address at the Foundation for North American Wild Sheep Conference, San Antonio, Texas, February 18, 1994. "I believe killing wildlife, as part of hunting, is acceptable only when it is the true and artful climax of the hunting ritual, practiced as the timeless art of self-sustenance, with reconnection to, and participation in, the natural process of 'life unto life only through death.' Full appreciation of this most fundamental and bittersweet process comes with full participation, and full participation through the hunt cannot occur without experiencing, first-hand, the kill." Mealey is Forest Supervisor of Boise National Forest. Copies on request Stephen P. Mealey, Boise National Forest, 1750 Front Street, Boise, ID 83702. (v5,#1)

Meaton, Julia, Morrice, David, "The Ethics and Politics of Private Automobile Use," Environmental Ethics 18(1996):39-54. Despite growing awareness of its various problems, private automobile use is still seen as an inviolable individual freedom. We consider the ethical arguments for and against private automobile use with particular reference to John Stuart Mill's theory of freedom. There is much evidence to show that private automobile use is an other-regarding harmful activity that is, therefore, on Mill's terms, liable to public control. Although it cannot be an entirely self-regarding activity, we consider

private automobile use in this category and argue that even on Mill's terms it can properly be subjected to extensive control. We also challenge Mill's theory and argue that private automobile use lacks adequate moral justification. We then consider the policy implications of this ethical argument and review some of the policy options available. We conclude that although an immediate total ban on private automobile use is justifiable, it is inadvisable at this time and that more limited, but effective control should be implemented in preparation for a total ban. Meaton is in geographical and environmental sciences, Huddersfield University, Yorkshire, UK. Morrice is in social sciences, Staffordshire University, UK. (EE)

Mech, L. David, "The Challenge and Opportunity of Recovering Wolf Populations," Conservation Biology 9 (1995): 270-78. There is an expanding opportunity for wolf recovery, but, because of the wolf's mobility, fertility, and long life, there are few places where wolves can be reintroduced without control, which means trapping and killing problem wolves. Those who favor wolves typically favor government rather than public control, but if control were allowed by the public (ranchers, landowners, hunters), this could be more effective and cheaper, more acceptable to those for whom wolves create problems, and allow wolves to live in far more places. Mech is the foremost wolf biologist in the world, with the National Biological Service, Laurel, MD, USA. (v6,#2)

Medeiros, Paul Joseph, Juxtaposing Aldo Leopold and Martin Heidegger: Interpretation, Time, and the Environment. Ph.D. thesis, Duke University. May, 2000. The concepts of authentic time, inauthentic time, and everyday time, articulated by Martin Heidegger in the 1924 lecture "The Concept of Time" and in Being and Time, are used to disclose American environmentalism as a tradition calling for a temporal modification of everyday life through engaged contact with the wild. The essays of conservationist Aldo Leopold, forerunner of contemporary environmental ethics, are chosen as representative of a tradition that includes Emerson, Thoreau, and Muir. The three main themes intrinsic to Leopold's essays--that our historical roots in the wild yield cultural values, that the whole of nature can be perceived as a community, and that we ought to respect and care for the land (the famous "land ethic")--are interpreted in terms of Heidegger's concepts of the authentic past, present, and future, respectively.

Issues of interpretation, specifically the linguistic and metaphysical obstacles to our understanding of Heidegger and the problem of a philosophical representation appropriate to Leopold and the American environmental tradition in general, are a major concern of the dissertation. These problems are unraveled by virtue of the dissertation's hermeneutical structure: Part I presents the evolution of the three themes in Leopold's essays leading up to their explicit formulation in A Sand County Almanac, Part II is a tripartite analysis of Heidegger's translated works from the 1966 Der Spiegel interview back to "The Concept of Time" guided by Leopold's themes, and Part III reinterprets Leopold's environmental philosophy, including the land ethic, in light of the results of Part II i.e., Heidegger's phenomenological conception of past, present, and future. The dissertation concludes that the possibility of authentically interpreting both Leopold and Heidegger in this circular manner is grounded in their common heritage in German Romanticism. Principal advisors were Alasdair MacIntyre and Gregory Cooper. (v.11,#1)

Medina, Ada, "The artist on process and ethics," Ethics and the Environment 8 (no. 1, 2003):3-21. Interview with Ada Medina. The conceptual and material processes behind her work. Art and philosophy, politics, nature, aesthetics, and her own creative practices. Art as "negotiating an in-between space, a threshold of contingency and flux, where oppositions permeate each other." Work in

environmental ethics and ecophilosophy also aims to engage liminal spaces, including nature/culture, thought/action, and self/other. In art and philosophy, the most interesting and innovative work does not stop at describing such dualisms, and does not aim to transcend them. Instead, it directs attention to the complexity and relation within any seeming opposition. Why that project is compelling and important. Medina is an artist, Santa Fe, NM. (E&E)

Medina, Martin. *The World's Scavengers: Salvaging for Sustainable Consumption and Production*. Walnut Creek CA: AltiMira Press, 2007. Medina tells us that up to 2% of the urban population in developing countries survives by salvaging materials from waste for recycling, which represents up to 64 million scavengers in the world today. Despite these numbers, we know little about the impact of scavenging on global capitalism development. The author examines its historical evolution and its linkages with formal and informal sector productive activities in capitalist and non-capitalist societies in case studies from Mexico, Brazil, Colombia, Argentina, Egypt, the Philippines, and India. He attempts to debunk popular perceptions about scavenging, demonstrating that many widely-held beliefs are wrong: scavenging is not primarily the activity of the poor nor is it a strictly marginal activity; the economic impact of scavenging is significant and can increase industrial competitiveness; and scavenging can be compatible with a sustainable waste management system. Scavenging represents an adaptive response to poverty, yet at the same time it can be a resource to cities, whose contributions should be recognized and understood.

Meijboom, Franck L. B. , "Trust, Food, and Health. Questions of Trust at the Interface between Food and Health," *Journal of Agricultural and Environmental Ethics* 20(2007):231-245. The food sector and health sector become more and more intertwined. This raises many possibilities, but also questions. One of them is the question of what the implication is for public trust in food and health issues. In this article, I argue that the products on the interface between food and health entails some serious questions of trust. Trust in food products and medical products is often based upon a long history of rather clear patterns of mutual expectations, yet these expectations are not similar in both sectors. As long as the food sector and health sector remain distinct, these differences will not lead to problems of trust, yet when new products are introduced, like functional foods or personalized dietary advices, trust can be threatened. To prevent this, we need clarity with regard to *what* we can expect of these new products and of *whom* to expect what in this situation. This requires not only adequate information on operating procedures, but also a profound debate on responsibilities and the explication and interpretation of moral values and norms. Keywords: functional food - health - personalized dietary advice - trust - trustworthiness. Meijboom is at Ethics Institute, Utrecht University, Utrecht, Netherlands.

Meijboom, Franck L. B., Tatjana Visak and Frans W. A. Brom, "From Trust to Trustworthiness: Why Information is not Enough in the Food Sector," *Journal of Agricultural and Environmental Ethics* 19(2006):427-442. The many well-publicized food scandals in recent years have resulted in a general state of vulnerable trust. As a result, building consumer trust has become an important goal in agri-food policy. In their efforts to protect trust in the agricultural and food sector, governments and industries have tended to consider the problem of trust as merely a matter of informing consumers on risks. In this article, we argue that the food sector better addresses the problem of trust from the perspective of the trustworthiness of the food sector itself. This broad idea for changing the focus of trust is the assumption that if you want to be trusted, you should be trustworthy. To provide a clear understanding of what being trustworthy means within the food sector, we elaborate on both the concept of trust and of responsibility. In this way we show that policy focused on enhancing transparency and providing information to consumers is crucial, but not sufficient for dealing with the problem of consumer trust in the current agri-food context. Keywords: food - food policy - responsibility - trust - trustworthiness. The authors are in the Ethiek Instituut, Utrecht University, Utrecht, The Netherlands. (JAEE)

Meilaender, Gilbert, "Terra es animata: On Having a Life," *Hastings Center Report* 23(no. 4, 1993):25-32. The contemporary concept of the person, dominant in bioethics, has lost the connection between our person and the natural trajectory of the bodily life, a strange upshot for bioethics. Premodern Christians knew persons as terra animata, animated earth. Persons are inseparable from the growth, development, and decline of their bodies. The humanist, Enlightenment concept of the person overlooks this and finds the essence of personality in rational autonomy, without which the organic body lacks all value. Among the peculiarities of our historicist and purportedly antiessentialist age is the rise to prominence of an ahistorical and essentialist concept of the person. On this view it is not the natural history of the embodied self but the presence or absence of certain transnatural capacities that makes the person. The so-called materialistic age ironically holds that everything central to our person is separated from the body. But to have a life is to be terra animata, a living body whose natural history has a trajectory. Every human life has a narrative quality, one that begins before we are conscious of it and may, in our decline, continue for a time after we have lost consciousness of it. This is relevant for how we interpret living wills. Also medical suicide, when a person takes rational, autonomous control over the circumstances of one's death, can elevate the cerebral over the biological dimensions of life. Meilaender is in religion at Oberlin College. (v5,#4)

Mejia, Alfonso Alonso, Lianne Tennant de Alonso, Lincoln Brower, and Dennis Murphy, "Maintaining Migratory Phenomena: The Mexican Monarch Butterfly Challenge," *Society for Conservation Biology Newsletter* 3 (special issue, May 1996):1, 17. The Monarchs winter in selected forests of Oyamel fir in Mexico, clustering in large groups in some eight or so areas. They need the protection of the forests to survive winter freezing, but forest destruction threatens their survival. Mexico has set aside a Monarch Butterfly Special Biosphere Reserve by presidential decree, though much of the reserve is private land, and only a portion of the reserve is fully protected. Logging is still permitted on much of it. Ways to combine butterfly protection and the economic needs of local peoples are reviewed. The authors, zoologists from the University of Florida, Harvard, and Stanford, have been involved in intensive study of the problem. (v7,#2)

Melin, Anders, "Genetic Engineering and the Moral Status of Non-Human Species," *Journal of Agricultural and Environmental Ethics* 17(2004):479-495. Genetic modification leads to several important moral issues. Up until now they have mainly been discussed from the viewpoint that only individual living beings, above all animals, are morally considerable. The standpoint that also collective entities such as species belong to the moral sphere have seldom been taken into account in a more thorough way, although it is advocated by several important environmental ethicists. The main purpose of this article is to analyze in more detail than often has been done what the practical consequences of this ethical position would be for the use of genetic engineering on animals and plants. The practical consequences of the holistic standpoint (focused on collective entities) of Holmes Rolston, III, is compared with the practical consequences of the individualistic standpoints (focused on individual living beings) of Bernard E. Rollin and Philipp Balzer, Klaus Peter Rippe, and Peter Schaber, respectively. The article also discusses whether the claim that species are morally considerable is tenable as a foundation for policy decisions on genetic engineering. Keywords: Balzer et al., genetic engineering, holistic ethical position, Rollin, Rolston. The author is at the Centre for Theology and Religious Studies, Lund University, Sweden. (JAEE)

Mellor, Mary. "Feminism and Environmental Ethics: A Materialist Perspective." Ethics and the Environment 5(2000):107-124. ABSTRACT: There is a long-standing claim within feminist literature that women speak with a 'different voice' (Gilligan 1982), that it is both possible and desirable to have on ethics from the standpoint of women (Noddings 1990), that the standpoint of women is a better starting point for adequate knowledge of the world (Harding 1993). This claim is central to ecofeminist politics. that women have a particular perspective on the relationship between humanity and nature and have a moral/political calling to reweave the world (Diamond and Orenstein 1990) or heal the wounds of an ecologically destructive social order (Plant 1989). In this essay I will not be making the claim that women

per se have a superior vision or a higher moral authority, but that (in ethics that does not take account of the gendered nature of society is doomed to failure as it will confront neither the material structure of human society or the way in which that structure impacts on the materiality of the relationship between humanity and nature. Mench, Joy A., "Assessing Animal Welfare: An Overview", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. Because of increasing public concern about the quality of life of farm animals, there has been a growing effort to develop rigorous and clearly interpretable scientific criteria for assessing animal welfare. The indicators which have commonly been used to assess welfare in farm animals are productivity, health, physiology and behaviour. Each of these indicators has advantages and disadvantages with regard to measurement and interpretation. One underlying problem is that it may be difficult or impossible to determine a norm or standard to which measures can be compared in an effort to evaluate welfare. Instead, it is necessary to direct attention to an understanding of the causal and functional aspects of behavioural and physiological events in animals. In this context, I discuss integrative research approaches which can be used to evaluate the emotional, motivational and cognitive factors affecting animal welfare. Mench is in the Department of Poultry Science, University of Maryland,

College Park, MD 20742.

With commentary: Chameides, William L., and Bergin, Michael, "Soot Takes Center Stage," Science 297(27 September 2002):2214-2215. Carbon dioxide is still the principal globally significant greenhouse gas. But soot in the air, not a gas but a particulate, may also seriously perturb regional climate. Soot emission in China and India may be responsible for the increase in droughts in northeast China and flooding in southeast China in the summer observed in the last twenty years. Warming over northern Africa and cooling over the Southern United States may also be involved. But measuring techniques for soot leave uncertainty. What this means for environmental policy (and ethics) is also uncertain. (v.13,#4)

Merchant, Carolyn, ed., Major Problems in American Environmental History: Documents and Essays. Lexington, MA: D. C. Heath, 1993. 544 pages. American environmental history from pre-contact Indian times to the present, each illustrated by several primary source documents and essays. Specific regional concerns as well as larger cultural issues including the confrontation between nature and civilization in the nineteenth century. Conservation, pollution, and wilderness preservation. Many dozens of documents over four centuries from the past to the present. With an instructor's manual. Merchant is professor of environmental history at the University of California, Berkeley. (v3,#4)

Merchant, Carolyn, Ecological Revolutions: Nature, Gender, and Science in New England. Chapel Hill: University of North Carolina Press, 1989. Pp. xv, 379. Important work of environmental history from a pioneer in the field. Merchant explores the colonization of New England from 1600-1850 as an example of the ecological transformations that shaped the dominant world-view of the twentieth century. In this period the ideas of mechanization, market-production, patriarchy, and domination became the controlling aspects of human consciousness regarding nature. As Merchant writes in the preface, this work continues the discussion of the themes of her earlier book, The Death of Nature: "the roots of the environmental crisis, the roles of women in history, the change from nature as mother to nature as machine, and the place of science in the creation of the modern world" (p. xiii). Contains detailed appendices, notes, and bibliography. (Katz, Bibl # 2)

Merchant, Carolyn, ed. Ecology: Key Concepts in Critical Theory. Atlantic Highlands, NJ: Humanities Press, 1994. 35 selections, reprints of previously published articles, organized in seven sections: (1) Critical Theory and the Domination of Nature, (2) Environmental Economics and Politics, (3) Deep, Social, and Socialist Ecology, (4) Ecofeminism, (5) Environmental Justice, (6) Spiritual Ecology, and (7) Postmodern Science. "Domination is one of our century's most fruitful concepts for understanding human-human and human-nature relationships. The theme of domination and its reversal through liberation unites critical theorists and environmental philosophers whose work spans the twentieth century. When the domination of nonhuman nature is integrated with the domination of human beings and the call for environmental justice, Critical Theory instills the environmental movement with ethical fervor" (p. 1). Merchant teaches environmental history, philosophy, and ethics in the Department of Environmental Science, Policy, and Management, University of California, Berkeley. (v7, #3)

Merchant, Carolyn. American Environmental History: An Introduction. New York: Columbia University Press, 2007. Merchant's illustrated environmental history begins with precolonial land-use practices of

Native American Indians and ends with the global ecological crisis of the twenty-first century. She discusses issues such as slavery, the expulsion of native peoples from national parks, population growth, suburban sprawl, wilderness preservation, the environmental justice movement, globalization, and the formative forces of race, gender, and class.

Merchant, Carolyn. "Environmental Ethics and Political Conflict: A View from California." Environmental Ethics 12(1990):45-68. I examine three approaches to environmental ethics and illustrate them with examples from California. An egocentric ethic is grounded in the self and based on the assumption that what is good for the individual is good for society. Historically associated with laissez faire capitalism and a religious ethic of human dominion over interests. A homocentric ethic is grounded in society and is based on the assumption that policies should reflect the greatest good for the greatest number of people and that, as stewards of the natural world, humans should conserve and protect nature for human benefit. Historically associated with government regulation of the private sector, a homocentric approach can be illustrated by federal, state, and local environmental agencies charged with protecting the welfare of the general public. An ecocentric ethic is grounded in the cosmos, or whole environment, and is based on the assignment of intrinsic value to nonhuman nature. Exemplified by ecologically based sciences and process-oriented philosophies, an ecocentric approach often underlies the political positions of environmentalists. This threefold taxonomy may be useful in identifying underlying ethical assumptions in cases where ethical dilemmas and conflicts of interest develop among entrepreneurs, government agencies, and environmentalists. Merchant is at the Department of Conservation and Resource Studies and Division of Biological Control, University of California, Berkeley. (EE)

Meretsky, VJ, et al., "New Directions in Conservation for the National Wildlife Refuge System," BioScience 56 (no. 2, February 2006): 135-143. The National Wildlife Refuge System Improvement Act of 1997 includes the nation's broadest statutory commitment to ecosystem protection: to "ensure that the biological integrity, diversity, and environmental health of the system are maintained." The act also

directs the US Fish and Wildlife Service (FWS) to expand the scope of conservation monitoring, assessment, and management beyond refuge boundaries to encompass surrounding landscapes. The act thus gives the FWS a leadership role in developing research and management partnerships with other agencies, organizations, and neighboring landowners. Increasing research capacity and scientific expertise, and strengthening institutional resolve to limit activities that impede the attainment of this directive, are challenges for the FWS. Success requires reexamination of existing priorities, refocused training, the acquisition of new funding and technical expertise, etc.

Metzner, Ralph, Green Psychology: Cultivating a Spiritual Connection with the Natural World. Inner Traditions International Ltd., 1999. Our ecocatastrophe results from the religions of Western civilization ceasing to be based on living harmoniously with the earth, and seeking dominion over nature instead of partnership. This created a pathology; we are disrespecting and destroying what sustains the human spirit. Deep ecology and ecofeminism are evidence of the human ability to return to the earth and bond spirit to nature. Metzner is a psychotherapist at the California Institute of Integral Studies, San Francisco. (v.10,#3)

Meyer-Abich, Klaus M. "Toward a Practical Philosophy of Nature." Environmental Ethics 1(1979):293-308. The application of the polluter-pays principle in environmental policy depends on answers to the philosophical questions about what is good or detrimental with respect to nature. Science

and the economy constitute a functional circle of "observing" nature's unity as well as its utility. Based on a concept of nature as a system of causally related objects or--complementary to this--as a bunch of "resources," however, the human interest and responsibility in nature do not seem to be properly observed. Subjecting nature to human subjectivity may have been an adaptation in the wrong direction, since, if humanity is taken as the measure, there is no measure for humanity. A practical philosophy of nature should start from the assumption that science's missing unity and the economy's missing goodness are equivalent shortcomings in a complementary way. On the one hand, philosophy should engage in the problem-oriented reintegration of the sciences by establishing nuclei of interdisciplinary cooperation. We are relating ourselves to nature in a responsible way only when approaching nature as our own nature. On the other hand, while our technological faculties have reached a very high level of reliability and differentiation, we are definitely much less successful in recognizing goodness in economic "goods." This calls for demand education with respect to how human needs are to be brought to bear as demands on nature, a human relation to nature as well as natural relations between human beings, again depending on answers to philosophical questions. In the history of ideas, nature has declined from "the nature of things and beings" to "the things and beings of nature," or from being to beings. We will, however, never be able to judge what is good or bad with respect to nature if we do not from the outset start--pragmatically--with a normative concept of nature. Meyer, Gitte, "Journalism and Science: How to Erode the Idea of Knowledge," Journal of Agricultural and Environmental Ethics 19(2006):239-252. This paper discusses aspects of the relationship between the scientific community and the public at large. Inspired by the European public debate on genetically modified crops and food, ethical challenges to the scientific community are highlighted. This is done by a discussion of changes that are likely to occur to journalistic attitudes - mirroring changing attitudes in the wider society - towards science and scientific researchers. Two journalistic conventions - those of science transmission and of investigative journalism - are presented and discussed in relation to the present drive towards commercialization within the world of science: How are journalists from these different schools of thought likely to respond to the trend of commercialization? Likely journalistic reactions could, while maintaining the authority of the scientific method, be expected to undermine public trust in scientists. In the long term, this may lead to an erosion of the idea of knowledge as something that cannot simply be reduced to the outcome of negotiation between stakeholders. It is argued that science is likely to be depicted as a fallen angel. This may be countered, it is posited, by science turning human, by recognizing its membership of society, and by recognizing that such membership entails more than just commercial relations. To rethink its relationship with the public at large - and, in particular, to rethink the ideal of disinterested science - is an ethical challenge facing the scientific community. Keywords: authority - commercialization - disinterestedness - public sphere - science journalism - trust. Meyer is in the Danish Centre for Bioethics and Risk Assessment, Valby, Denmark, also the International Center for Business and Politics, Copenhagen Business School, Frederiksberg, Denmark. (JAEE)

Michael, Mark A., "What's In a Name? Pragmatism, Essentialism, and Environmental Ethics," Environmental Values 12(2003): 361-379. Essentialists like J. Baird Callicott have argued that one cannot have an environmental ethic unless one adopts the nonanthropocentric principle, which holds that things other than humans can be morally considerable in their own right, typically because they are thought to be intrinsically valuable. Pragmatists like Bryan Norton reject this; they claim that environmental ethics has no core or essence, and hence that the nonanthropocentric principle is not essential to an environmental ethic. Norton advances as an alternative the Convergence Hypothesis, which says that there are many different ways of justifying environmental principles and policies. In this paper I show that pragmatists and essentialists are arguing past one another because they fail to note two crucial points. First, they often propose different accounts of which principles constitute an environmental ethic and so they disagree about which principles must be justified. The nonanthropocentric principle may be required to justify the principles that Callicott believe to be constitutive of an environmental ethic, but it may be unnecessary to justify those principles that pragmatists think are constitutive. Second, essentialists and pragmatists often overlook the distinction to be made between the adequacy of a justification and its epistemic or rhetorical preferability. The nonanthropocentric principle may not be needed to provide an adequate justification of the constitutive principles and judgements, but a justification that contains the nonanthropocentric principle might nevertheless be epistemically preferable. Michael, Mark A., "To Swat or Not to Swat: Pesky Flies, Environmental Ethics, and the Supererogatory," Environmental Ethics 18(1996):165-180. A central thesis of biocentrism is that all living things have intrinsic value. But when conflicts arise between the interests of humans and other organisms, this claim often has counterintuitive consequences. It would be wrong, for example, to swat pesky flies. Some biocentrists have responded by positing a taxonomy of interests in which human interests justifiably supersede those of other living things. I express doubts about whether this maneuver can succeed, and

suggest that even if it does, it then commits biocentrists to the claim that it is wrong not to harm living things, when doing so is necessary to advance nonbasic human interests, a position which runs counter to the biocentric attitude of respect for nature. As a result, biocentrists must adopt either a highly counterintuitive position or one that is contrary to their general outlook. I show that the introduction of the supererogatory may resolve not only this biocentric dilemma but other quandaries in environmental ethics. Michael teaches philosophy at Austin Peay State University, Clarksville, TN. (EE)

Michael, Mark A. "Environmental Egalitarianism and 'Who Do You Save?' Dilemmas," Environmental Values 6(1997):307-326. ABSTRACT: Some critics have understood environmental egalitarianism to imply that human and animal lives are generally equal in value, so that killing a human is no more objectionable than killing a dog. This charge should be troubling for anyone with egalitarian sympathies. I argue that one can distinguish two distinct versions of equality, one based on the idea of equal treatment, the other on the idea of equally valuable lives. I look at a lifeboat case where one must choose between saving a human and saving a dog, and using the work of Peter Singer and Tom Regan, I show why equality understood as equal treatment does not entail that lifeboat cases are moral toss-ups. But the view that all lives are equally valuable does entail this, and so egalitarians should reject this alternative account of equality. The upshot is that egalitarians need to be more careful about distinguishing between these two versions of equality. The failure to insist on this distinction has led many to believe that egalitarianism generally has counter-intuitive implications when in fact only one version of egalitarianism has this problem. Michael, Mark, "An Alternative to the Common Heritage Principle," Environmental Ethics 9(1987):351-371. An argument in favor of a modified Lockean principle of acquisition regarding unowned resources. Nations should be permitted to acquire resources they develop, as long as there is some international mechanism to prevent overexploitation. This "limited Lockean" principle preserves fairness, freedom, and the maximization of the common good. (Katz, Bibl # 1)

Michael, Mark A., "Is It Natural to Drive Species to Extinction?" Ethics and the Environment 10(no. 1, 2005):49-66. Whether or not extinction caused by human activities is natural depends on which sense of the term "natural" is under consideration. Given one sense of that term which has some grip on the popular imagination, it is. This suggests that at a minimum environmentalists should be very careful about invoking "the natural" and related concepts such as "acting naturally" when they propose moral principles. I argue here for the stronger claim that the "natural" is either redundant and serves to obscure more than it brings to light, or that it is bound up with a picture of the world which is false, and so theoretically useless. Thus "the natural" can do no useful theoretical work in a completely developed environmental ethic. Michael is in philosophy, Austin Peay State University, Clarksville, TN. (Eth&Env)

Michael, Mark. "An Alternative to the Common Heritage Principle." Environmental Ethics 9(1987):351-71. Many valuable natural resources are found outside current territorial limits, for example, on the Moon and in the deep sea. As technology advances, these resources become more accessible. I argue that the claim that all humanity owns these resources is insupportable if taken literally. Because they are truly unowned, we need to develop a principle of justice in acquisition which describes the procedure that must be followed to obtain property rights to these unowned objects. I conclude with a tentative development of such a principle based on the moral ideals of fairness, freedom, and the maximization of the common good. Michael, Mike, and Robin Grove-White. "Talking about Talking about Nature: Nurturing Ecological Consciousness." *Environmental Ethics* 15(1993):33-47. The increasing effort, both lay and academic, to encourage a transition from an "I-It" to an "I-Thou" relation to nature is located within a typology of ways of "knowing nature." This typology provides the context for a particular understanding of human conversation which sees the relation as a cyclical process of "immersion" and "realization" from which a model of the dialectic between "I-It" and "I-Thou" relations to nature can be developed. This model can be used to identify practical measures that can be taken as first steps toward a balance between these relations, both in general and in the context of science-oriented nature conservation organizations such as English Nature in Britain (formerly, the Nature Conservancy Council). Michalopoulos, Tassos, Michiel Korthals and Henk Hogeveen, "Trading Ethical Preferences in the Market: Outline of a Politically Liberal Framework for the Ethical Characterization of Foods," *Journal of Agricultural and Environmental Ethics* 21(2008):3-27. The absence of appropriate information about imperceptible and ethical food characteristics limits the opportunities for concerned consumer/citizens to take ethical issues into account during their inescapable food consumption. It also fuels trust crises between producers and consumers, hinders the optimal embedment of innovative technologies, "punishes" in the market ethical producers, and limits the opportunities for politically liberal democratic governance. This paper outlines a framework for the ethical characterization and subsequent optimization of foods (ECHO). The framework applies to "imperceptible," "pragmatic," and "reasonable" food characteristics about which consumers/citizens maintain concerns. A political perspective is assumed in that valid information is taken to serve the politically liberal and democratic functions of the market by allowing concerned citizens to make informed choices in their role as food consumers. Information is aggregated by multi-attribute modeling. It takes the form of "maximized" ("utilitarian") to "most balanced" (MINMAX) non-binary aggregate comparative rankings of perceptibly substitutable food products. The model requires the description of characteristics by means of criteria and weights

(structural input), and technical input on the performance of food for these criteria (product input). Structural input is grounded on relevantly concerned citizen/consumers' perceptions. It is culture and times dependent. Availability of product input is assumed. Uses for the amelioration of the aforementioned limitations are discussed. So long as, and to the extent that, certain ethical concerns are not addressed by public policy, the ECHO framework may facilitate offering members of society a necessary (though not a sufficient) condition for regulating the ethical aspects of food production in self-regulated markets as consumers, when they are constrained to do so through their government as citizens. In doing that, the framework may contribute to the development of the ethical dimension of food production and may bring rewards for food supply actors that take reasonable concerns of citizen/consumers into account. The authors are at the Applied Philosophy and Business Economics groups, Centre for BioSystems Genomics, Wageningen University, The Netherlands.

If science is not furnished with a sensible one, it cannot fail to gather a wild one. (v6,#4)

Midgley, Mary, "Beasts Versus the Biosphere?" Environmental Values Vol.1 No.2(1992):113-122. ABSTRACT: Apparent clashes of interest between 'deep ecologists' and 'animal liberationists' can be understood as differences in emphasis rather than conflicts of principle, although it is only too easy for campaigners to regard as rivals good causes other than their own. Moral principles are part of a larger whole, within which they can be related, rather than absolute all-purpose rules of right conduct. This is illustrated using the practical dilemma which often occurs in conservation management, of whether or not to cull animals that are damaging their habitat by overgrazing. Here, and in general, when we are faced with a choice between two evils, the need for scrupulous discrimination and honesty cannot be overstated; but it is not a worthy option to retreat behind moral principles of limited application. Midgley, Mary, "Sustainability and Moral Pluralism," Ethics and the Environment 1(no.1, 1996):41-54. Discussions of environmental ethics, and of applied ethics generally, easily produce a sense of unreality. But they are not a luxury. Faced with a new and monstrous predicament, we do need new thinking. Enlightenment morality, on which we still largely rely, has had enormous merits, but it strongly tends towards egoism and social atomism. This makes it hard for us to think, as we now must, about larger wholes. Midgley taught philosophy at the University of Newcastle upon Tyne, U.K. (E&E)

Millar, Heather. "Coverage for Carnivores." *National Wildlife* Vol. 46, no. 2 (February/March 2008): 30J-30P. Project Snow Leopard is a program to insure herders in Pakistan against livestock losses to snow leopards. The program has been worked out by a native Pakistani and Yale University Ph.D. student, Shafqat Hussain, mixes the modest insurance investments of local herders with income from ecotourism and foundation grants, and is administered in such a way, including herder participation and decisions about payments, that non-cooperation and cheating are discouraged. As a result, unlike other such compensation programs, this one seems to be working well.

Millar, Kate, and Sandy Tomkins, "Ethical Analysis of the Use of GM Fish: Emerging Issues for Aquaculture Development," *Journal of Agricultural and Environmental Ethics* 20(2007):437-453. Improvements in production methods over the last two decades have resulted in aquaculture becoming a significant contributor to food production in many countries. Increased efficiency and production levels are offsetting unsustainable capture fishing practices and contributing to food security, particularly in a number of developing countries. The challenge for the rapidly growing aquaculture industry is to develop and apply technologies that ensure sustainable production methods that will reduce environmental damage, increase productivity across the sector, and respect the diverse social and cultural dimensions of fish farming that are observed globally. The aquaculture industry currently faces a number of technology trajectories, which include the option to commercially produce genetically modified (GM) fish. The use of genetic modification in aquaculture has the potential to contribute to increased food security and is claimed to be the next logical step for the industry. However, the potential use of these technologies raises a number of important ethical questions. Using an ethical framework, the Ethical Matrix, this paper explores a number of the ethical issues potentially raised by the use of GM technologies in aquaculture. Several key issues have been identified. These include aspects of distributive justice for producers; use of a precautionary approach in the management of environmental risk and food safety; and impacts on the welfare and intrinsic value of the fish. There is a need to conduct a comparative analysis of the full economic cycle of the use of GM fish in aquaculture production for developing countries. There is also a need to initiate an informed dialogue between stakeholders and strenuous efforts should be made to ensure the participation of producers and their representatives from developing nations. An additional concern is that any national licensing of the first generation of GM fish, i.e., in the USA, may initiate and frame an assessment cycle, mediated by the WTO, which could dominate the conditions under which the technology will be applied and regulated globally. Therefore, an integrated analysis of the technology development trajectories, in terms of international policy, IPR, and operational implications, as well as an analysis of a broader range of ethical concerns, is needed. Millar and Tomkins are at the Centre for Applied Bioethics, School of Biosciences, University of Nottingham, UK.

Millar, Kate, et al., "Developing the Ethical Delphi," *Journal of Agricultural and Environmental Ethics* 20(2007):53-63. A number of EU institutions and government committees across Europe have expressed

interest in developing methods and decision-support tools to facilitate consideration of the ethical dimensions of biotechnology assessment. As part of the work conducted in the EC supported project on ethical tools (Ethical Bio-TA Tools), a number of ethical frameworks with the potential to support the work of public policy decision-makers has been characterized and evaluated. One of these potential tools is the Delphi method. The Delphi method was originally developed to assess variables that are intangible and/or shrouded in uncertainty by drawing on the knowledge and abilities of a diverse group of experts through a form of anonymous and iterative consultation. The method has hitherto been used by a diversity of practitioners to explore issues such as technology assessment, environmental planning, and public health measures. From the original (classical) Delphi, a family of Delphi-related processes has emerged. As a result of the evaluation of the various Delphi processes, it is proposed that the classical method can be further developed and applied as a form of ethical framework to assist policy-makers. Through a series of exercises and trials, an Ethical Delphi has been developed as a potential approach for characterizing ethical issues raised by the use of novel biotechnologies. Advantages and disadvantages of the method are discussed. Further work is needed to develop the procedural aspects of the Ethical Delphi method and to test its use in different cultural contexts. However, utilizing an ethical framework of this type combines the advantages of a methodical approach to capture ethical aspects with the democratic virtues of transparency and openness to criticism. Ethical frameworks such as the Ethical Delphi should contribute to better understanding of and decision-making on issues that involve decisive ethical dimensions. Keywords: ethical frameworks - biotechnology - Delphi method - GM fish - Ethical Delphi. The authors are at the Centre for Applied Bioethics, School of Biosciences, University of Nottingham, Sutton Bonington Campus, Loughborough, Leicestershire, UK.

Millennium Ecosystem Assessment, Ecosystems and Human Well-Being: A Framework for Assessment. Washington: Island Press, 2003. Co-editors Harold Mooney, Angela Cropper. A four-year international work program designed to meet the needs of decision-makers for scientific information on the links between ecosystem change and human-well being. One of the contributors is J. Baird Callicott. A program launched by the U.N. Secretary-General. (v.14, #4)

--Millennium Ecosystem Assessment. *Living Beyond our Means: Natural Assets and Human Well-Being: Statement from the Board*. 2005. Walter V. Reid is the Director. This is a huge project sponsored by the United Nations and a host of organizations and corporations and involving some 1,360 experts worldwide. This report begins: "At the heart of this assessment is a stark warning. Human activity is putting such strain on the natural functions of Earth that the ability of the planet's ecosystems to sustain future generations can no longer be taken for granted" (p. 5). They are releasing five technical volumes, published by Island Press in early 2006: Vol. 1: Current State and Trends: Findings of the Condition and Trends Working Group. Vol. 2. Scenarios: Findings of the Scenarios Working Group. Vol. 3. Public Response: Findings of the Responses Working Group. Vol. 4. Multiscale Assessments: Findings of the Sub-global Assessments Working Group. (5) Our Human Planet: Summary for Decision-makers.

There is a massive website: <http://maweb.org>. Various presentations are available there and can be downloaded, including some in PowerPoint. Also a World Health Organization spinoff: Ecosystems and Human Well-Being: Health Synthesis. Another one is Ecosystems and Human Well-Being: Wetlands and Water Synthesis. Yet another is Ecosystems and Human Well-Being: Opportunities and Challenges for Business and Industry. A basic framework is to classify ecosystem services into four categories: (1) Supporting Services, those that result directly from ecosystem functioning, such as nutrient cycling and primary production. (2) Provisioning Services, the products obtained directly such as food, fresh water, fuel wood. (3) Regulating Services, such as climate regulation, erosion control, control of pests and diseases, often viewed as "free" services. (4) Cultural Services, nonmaterial benefits such as cultural heritage values, sense of place, spiritual and inspirational values. An earlier publication is: Ecosystems

and Human Well-Being: A Framework for Assessment. Washington: Island Press, 2003. Co-editors Harold Mooney, Angela Cropper.

The Millennium Ecosystem Assessment leaders won the million dollar Zayed Prize, funded by the crown prince of Dubai. Half of it went to United Nations Secretary-General Kofi Annan for his championing the project; \$ 300,000 to the project itself, and \$ 200,000 to panel co-chairs Angela Cropper and Emil Salim, the former Indonesian environmental minister. Kofi Annan will use his prize money to establish a foundation to promote agriculture and women's education in Africa. Science 311 (17 February 2006): 949.

Miller, Charles A., Jefferson and Nature: An Interpretation. Baltimore: Johns Hopkins University Press, 1988. 300 pages. The first comprehensive study to take Thomas Jefferson at his word--his favorite word. Nature--the term and the many ideas associated with it--pervades Jefferson's life and writings. It sets him apart from his colleagues in the American Enlightenment and provides the distinctive gateway to this thought and action. By no means consistent and at times apparently opportunistic in his use of the term, Jefferson nevertheless draws nearly every realm of life back to this essential word and idea. Miller teaches politics at Lake Forest College, Lake Forest, Illinois. (v8,#3)

Miller, Chris, "Attributing Priority to Habitats," Environmental Values 6(1997):341-353. ABSTRACT: A close scrutiny of a European Community directive on habitats and of the statutory instrument by which it is implemented in Britain reveals small but nevertheless significant concessions towards an ecocentric approach. Planning law now allows interference in the habitats of protected species only when human interests are demonstrably overriding. Recent decisions of the European Court of Justice have given a very restrictive interpretation of the circumstances in which such interference may be permitted. The implications for further ecocentric influence in environmental law are discussed. European Studies Research Institute, University of Salford, Salford, M5 4WT, UK. (EV)

Miller, Clark A. "The Dynamics of Framing Environmental Values and Policy: Four Models of Societal Processes." Environmental Values 9(2000):211-233. Abstract: While the subject of framing has achieved considerable recognition recently among social scientists and policy analysts, less attention has been given to how societies arrive at stable, collective frames of meaning for environmental values and policy. This paper proposes four models of societal processes by which framing occurs: narration, modelling, canonisation and normalisation. These four models are developed, compared, and explored in detail through a case study of the framing of the impacts of climate change on human societies in US science policy from the 1960s through the 1990s. I conclude by offering a number of potentially fruitful avenues for further research into the dynamics of framing. Keywords: Framing, climate change, environmental values, environmental policy. Clark A. Miller is in the Department of Political Science, Iowa State University, 515 Ross Hall, Ames, IA 50011, USA. (EV)

Miller, Clark A. and Edwards, Paul N., ed., Changing the Atmosphere: Expert Knowledge and Environmental Governance. Cambridge, MA: MIT Press, 2001. The contributors argue that in the current debate about global warming the distinction between science and policy is almost absent. Environmental "science's place in global policymaking is increasingly formalized, boosting its authority in policymaking processes but also subjecting it to new forms of political and legal oversight and review. International expert institutions such as the IPCC (Intergovernmental Panel on Climate Change) increasingly determine which knowledge counts and which does not, helping to shape crucial policy outcomes" (Miller and Edwards, introduction). Meanwhile, climate models have more uncertainty by far than weather models and we do not know enough about historical climate changes over the millennia to make good predictions. Contains:

-Jamieson, Dale, "Climate Change and Global Environmental Justice," pp. 287-307. Scientific knowledge and conceptions of justice. Two views of global environmental justice, and a proposal for the distribution of emissions permissions embodying concerns about justice. But its adoption is unlikely, and the likely outcomes are more unjust. (v.13,#1)

Miller, Elaine P., "'The World Must be Romanticised ...': The (Environmental) Ethical Implications of Schelling's Organic Worldview," Environmental Values 14(2005): 295-316. This essay addresses the implications of German Idealism and Romanticism, and in particular the philosophy of Schelling as it is informed by Kant and Goethe, for contemporary environmental philosophy. Schelling's philosophy posits a nature imbued with freedom which gives rise to human beings, which means that any ethics, insofar as ethics is predicated upon freedom, will be an "environmental ethic". At the same time, Schelling's

organismic view of nature is distinctive in positing a fundamental gap between nature and human beings. Without this absolute alterity, there could be no real ethical relationship between human beings and nature. I conclude by briefly gesturing toward Schelling's role in the development of an ethics of alterity (which I apply to environmental ethics) in continental philosophy through Heidegger, Derrida, and Levinas. Miller is in philosophy, Miami University, Oxford, OH. (EV)

Miller, Gifford H., "Ecosystem Collapse in Pleistocene Australia and a Human Role in Megafaunal Extinction," *Science* 309(8 July 2005):287-290 and commentary 255-256. The arrival of humans in the Americas after the ice ages coincides, more or less, with some megafaunal extinctions, but it is difficult to separate climate change from human hunting as a cause. Australia had no such ice ages and it had had humans much longer (c. 11,000 vs. 45,000 years). Coinciding with human arrival there, more or less, one larger flightless bird went extinct (*Genyornis*) and another did not (the emu, continuing to the present). The authors find a sudden change in emu diet at the time of human arrival, shifting from mostly photosynthetic C3 plants (shrubs, trees, herbs) to C4 plants (grasses). The authors surmise that the change from woodlands to grassland was caused by humans lighting fires and that *Genyornis* could not adapt to this change but that the emu could. If so, this is one of the few widespread ecosystem changes attributable to aboriginal peoples. One problem: no charcoal records exist for this region.

Miller, Gordon L., ed. *Nature's Fading Chorus*. Covelo, CA: Island Press, 2000. Declining amphibian life, figured into the worldviews of the many writers, scientists, and naturalists who considered amphibians across Western natural history tradition. Begins with Aristotle and continues through recent scientific accounts of declines and deformities in amphibian species. (v.11,#4)

Miller, Greg. "All Together NowPull!" *Science* Vol. 317, no. 5843 (7 September 2007): 1338-40. Miller researches social behavior in chimpanzees, particularly how far and when they will cooperate with each other to gain food that is out of reach by together pulling ropes that enables them to retrieve the food. Some do, some don't, and some are more tolerant of collaboration than others. Behavior may depend on whether food is, or has been, shared. Most such behavior is with captive chimps in laboratory conditions. Little such behavior has been observed in the wild.

Miller, Greg. "Animal Extremists Get Personal." *Science* Vol. 318, no. 5858 (21 December 2007): 1856-58. As animal rights extremism wanes in the United Kingdom, US researchers have faced increasing threats and harassment. The Animal Liberation Brigade has left a bomb on the doors of the home of a physician-researcher and physicians that are involved in a study to test an electrical stimulator that could bring paralyzed eye muscles back to life in children.

Miller, Greg. "The Roots of Morality." *Science* Vol. 320, no. 5877 (9 May 2008): 734-37. Neurobiologists, philosophers, psychologists, and legal scholars are probing the nature of human morality using a variety of experimental techniques and moral challenges. New studies tend to support the view of David Hume that emotions drive moral judgments, contrary to Immanuel Kant's arguments that reason should be the driving force. Many of these conclusions are based on what parts of the brain (as found in neuroimaging) are active in making moral decisions. Critics respond that the testing situations used involve quick responses to unfamiliar moral situations (flipping a track switch to decide who gets killed) and does not allow for a more sustained context of moral reasoning.

Miller, Harlan B., and William H. Williams, eds., *Ethics and Animals*. Clifton, New Jersey: Humana, 1983. Pp. xii, 400. This is not an important book for those interested in environmental ethics. Even the few articles that deal with environmental issues seem dated--perhaps because the conference in which these papers were presented was held in 1979. The only article of real interest is Peter S. Wenz, "Ecology, Morality, and Hunting" (pp.183-197). Wenz argues that we have obligations to ecosystems, not just to humans or other sentient beings. He then claims that we can use this obligation to limit the

practice of hunting. (Katz, Bibl # 1)

Miller, JR; Turner, MG; Smithwick, EAH; Dent, CL; Stanley, EH, "Spatial Extrapolation: The Science of Predicting Ecological Patterns and Processes", BioScience 54 (no.4, 2004): 310-320(11). Ecologists are often asked to contribute to solutions for broadscale problems. The extent of most ecological research is relatively limited, however, necessitating extrapolation to broader scales or to new locations. Spatial extrapolation in ecology tends to follow a general framework in which (a) the objectives are defined and a conceptual model is derived; (b) a statistical or simulation model is developed to generate predictions, possibly entailing scaling functions when extrapolating to broad scales; and (c) the results are evaluated against new data. In this article, we examine the application of this framework in a variety of contexts, using examples from the scientific literature. We conclude by discussing the challenges, limitations, and future prospects for extrapolation.

Miller, Lantz, "Filling the Gaps in the Risks vs. Benefits of Mammalian Adult-Cell Cloning: Taking Bernard Rollin's Philosophy Its Next Step," Journal of Agricultural and Environmental Ethics 11(1998):1-16. ABSTRACT. A critique is made of Bernard Rollin's examination of the ethics of cloning adult mammalian cells. The primary concern is less to propound an anticloning or procloning position than to call for full exploration of the ethical complexities before a rush to judgment is made. Indeed, the ethical examination in question rushes toward an ethical position in such a way that does not appear consistent with Rollin's usual methodology. By extending this methodology - which entails full weighing of benefits and costs - it becomes apparent that there are real potential risks to this type of cloning in both animals and humans, besides the possible benefits, and that the scientific, political, philosophical, and broader academic communities should explore these risks and benefits extensively. Rollin's usual methodological call for hesitation before risks would translate into hesitation before the ethical risks of adult mammalian cell cloning instead of his paper's curiously laissez-faire stance. KEY WORDS: animal adult-cell cloning, human adult-cell cloning, genetic ecology, genetic monoculture, synchronic genetic diversity, diachronic genetic diversity, rights of future generations. (JAEE)

Miller, Mara, The Garden as an Art. Albany: SUNY Press, 1993. 273 pages. Paper, \$ 18.95. Theoretical issues in aesthetics that gardens raise, with examples. Miller challenges contemporary aesthetic theory to include gardens in an expanded definition of art. Gardens mix art and nature in varying proportions. She challenges the idea that art should be studied within the context of a single culture and period, the idea that art should be conceived as a discrete object unrelated to our survival as persons, as cultural communities, and as a species. She challenges the idea that all signifying systems are like language use. The element of nature in gardens is part of this challenge. Miller is director of the Asian Studies Program and teaches philosophy at Drew University. (v5,#2)

Miller, Pamela A., The Implications of John Dewey's Ideas for Environmental Ethics (Pragmatism), 1998, Indiana University, Ph.D. thesis. 515 pages. Dewey's pragmatism identifies and addresses conflicts between human and nonhuman interests that can help bridge the gap between practice and theory in environmental ethics. Traditional arguments in environmental ethics often give little or no guidance in conflicts faced in practice. Dewey's philosophy offers an alternative that gives direction to practitioners for resolving conflicts so that all parties to a conflict 'grow' as a result of the conflict. This requires focus on the notions of inquiry, experience, growth, the idea of character in moral judgment, and Dewey's concept of the "good". A Deweyan approach to environmental ethics lends support to major claims of the ecofeminists. The advisor was Karen Hanson. (v.10,#1)

Miller, Peter, "Descartes' Legacy and Deep Ecology." Dialogue 28 (1989): 183-202. An argument for an axiology of "extended naturalism." This view is contrasted with a pure Cartesian separation of value from the material world and with a modified Cartesian "projectionist" axiology that insists value must be based in the mind of a conscious evaluator. Projectionism is in "the firm grip of the Cartesian legacy" because "not only the appreciation but also the very existence of those values 'within' the non-human natural order [are] contingent upon human altruistic sentiments, value experiences, or evaluations" (p. 194). The mistake is the confusion of "epistemic primacy with ontological primacy" (p. 199). (Katz, Bibl # 2) (v1,#1)

Miller, Peter. "Do Animals Have Interests Worthy of Our Moral Interest?" Environmental Ethics 5(1983):319-33. The conclusion of animal liberationists that the underlying assumptions of modern egalitarian humanism can be construed to imply an equal moral desert for the higher nonhuman animals has recently been challenged by R. G. Frey on the grounds that linguistic incompetence and lack of self-consciousness on the part of animals preclude them from having desires, beliefs, interests, and rights. Although Frey's arguments fail, they challenge us to provide alternative accounts of these descriptive and normative categories of human and animal psychology. Phenomenological and behavioral analyses demonstrate both the meaningfulness and the truthfulness of attributing desires, beliefs, and interests to many nonhuman animals. Principles of axiology and ethics prescribe that animal interests ought to be objects of our moral concern, but do not vindicate an egalitarian interpretation of animal liberation. A fundamental challenge of the animal liberation debate is how to frame a nonegalitarian ethic that can nevertheless preserve the moral gains of various liberation movements inspired by principles of equality.

Miller is in the philosophy department, University of Winnipeg, Winnipeg, Canada. (EE)

Miller, Peter. "Value as Richness: Toward a Value Theory for the Expanded Naturalism in Environmental Ethics." Environmental Ethics 4(1982):101-14. There is a widespread conviction amongst nature lovers, environmental activists, and many writers on environmental ethics that the value of the natural world is not restricted to its utility to humankind, but contains an independent intrinsic worth as well. Most contemporary value theories, however, are psychologically based and thus ill-suited to characterize such natural intrinsic value. The theory of "value as richness" attempts to articulate a plausible nonpsychological theory of value that accommodates environmentalist convictions as well as more traditional value concerns. It has implications not only for our care for and preservation of nature, but also for the enrichment of human lives. Miller is in the philosophy department, University of Winnipeg, Winnipeg, Canada. Mills, Ian. "Dwelling in No-Place: Our Ethical Between." Environmental Ethics 28(2006):413-428. Suggestions made by Luce Irigaray in her book, An Ethics of Sexual Difference, may offer a solution to a problem in environmental ethics which has much in common with the gender problem: the tendency of the masculine to exploit the Other as "a-place-to-be-in." If humans are to achieve the ethicality of mutually beneficial, sustainable relating with all beings, we need to initiate an economy of desire which has regard to a reciprocity of receptivity-activity, as a way of safeguarding a clear space open to the kind of relating that makes possible a "permanent becoming" together of all beings. We need to live in a psychic No-Place, to experience our environment as the potentially infinite "Open" of "our-between." (EE)

Millstone, Erik, "Can food safety policy-making be both scientifically and democratically legitimated? If so, how?" *Journal of Agricultural and Environmental Ethics* 20(2007):483-508.

This paper provides an analysis of the evolution of thinking and talking about the role of scientific knowledge and expertise in food safety policy-making, and in risk policy-making more generally from the late 19th century to the present day. It highlights the defining characteristics of several models that have been used to represent and interpret the relations between policy-makers and expert scientific advisors and between scientific and political considerations. Both conceptual and empirical strengths and weaknesses of those models are identified, focusing in particular on the ways in which they deal with scientific uncertainties and social choices. By drawing on both empirical evidence and conceptual analysis, a novel and more realistic model is provided along with an account of some conditions for food safety policy-making achieving both scientific and democratic legitimacy. Keywords. democratic legitimacy - public policy - science - scientific legitimacy.

Milly, P.C.D., Julio Bentancourt, Malin Falkenmark, Robert M. Hirsch, Zbigniew W. Kundzewicz, Dennis P. Lettenmaier, and Ronald J. Stouffer. "Stationarity is Dead: Whither Water Management." *Science* Vol. 319, no. 5863 (1 February 2008): 573-74. Climate change undermines a basic assumption that historically has facilitated water management: natural flow systems fluctuate within limits of variability ("stationarity"). "Substantial anthropogenic change of Earth's climate is altering the means and extremes of precipitation, evapo-transpiration, and rates of discharge of rivers." That poses enormous challenges in water management.

Milton, Kay, Environmentalism and Cultural Theory: Exploring the Role of Anthropology in Environmental Discourse. New York: Routledge, 1996. Environmentalists often claim that non-industrial societies, usually described as "indigenous" or "traditional," have a better relationship with their environment than industrial societies do. A growing body of anthropological literature has thrown doubt on this belief, and suggests that it should be seen as a "myth," both in the popular sense of something that is untrue and in the sense often used by anthropologists as something that is asserted as dogma. Our contemporary understanding of these cultures is shaped by our pre-conceptions and by the arguments we wish to pursue. Both the reality of human-environment relations, and our interpretations of them, are

considerably more complex than the environmentalist myth suggests. Milton teaches social anthropology at the Queen's University, Belfast. (v8,#3)

Milton, Kay. "Nature is Already Sacred." Environmental Values 8(1999):437-449. ABSTRACT: Environmentalists often argue that, in order to address fundamentally the harmful impact of their activities on the environment, western industrial societies need to change their attitude to nature. Specifically, they need to see nature as sacred, and to acknowledge that humanity is a part of nature rather than separate from it. In this paper, I seek to show that these two ideas are incompatible in the context of western culture. Drawing particularly on ideas expressed by western conservationists, I argue that nature is already seen as sacred, and that its sacredness depends on it being seen as separate from humanity, an idea which effectively contradicts the scientific knowledge on which many conservationists base their actions. Goodin's green theory of value is used as a source of ideas about why non-human nature is experienced as sacred, and can be extended to suggest that other values, such as "development" and "progress", are also seen as sacred. KEYWORDS: Nature, sacredness, conservation, non-human nature, western culture. Mineau, Pierre, McLaughlin, Alison. "Conservation of Biodiversity Within Canadian Agricultural Landscapes: Integrating Habitat for Wildlife," Journal of Agricultural and Environmental Ethics 9(1996):93-113. This review of current literature considers the potential for non-crop areas within agricultural landscapes to be reservoirs of agronomically beneficial organisms including plants, invertebrates, and vertebrate species. Non-crop habitats adjacent to crop land have been identified as significant for the maintenance of plant species diversity, for the conservation of beneficial pollinating and predatory insect and as essential habitat for birds. A key component for enhancement of biodiversity is the reintroduction of landscape heterogeneity by (1) protection and enhancement of key non-crop areas, (2) smaller fields and farms, and (3) a greater mixture of crops, through rotation, intercropping and regional diversification. The benefits of increased biodiversity within arable lands are reviewed for various species groups. The problems of crop depredation by vertebrate species, weed and insect competition are also discussed. Keywords: biodiversity, wildlife habitat, agriculture, hedgerows, field margins. Mineau and McLaughlin are with the Canadian Wildlife Service, Hull, Quebec. (JAEE)

Minteer, Ben A., "No Experience Necessary? Foundationalism and the Retreat from Culture in Environmental Ethics," Environmental Values 7(1998): 333-348. Many of the leading contributors to the field of environmental ethics demonstrate a preference for foundationalist approaches in their theoretical

justifications of environmentalism. I criticise this tendency as it figures in the work of Holmes Rolston III, J. Baird Callicott, and Eric Katz. I illustrate how these writers' desire for philosophical absolutes leads them to reject the moral resources present within human culture; a move that carries with it a number of troubling philosophical and political problems. I conclude that environmental theorists would be better served by taking a more contextual, social, and pragmatic approach to justifying their moral projects regarding nature, and that this mode of inquiry will ultimately lead toward a more philosophically sound and democratically authentic environmental ethics. KEYWORDS: environmental ethics, foundationalism, pragmatism, contextualism. Ben A. Minteer is at the University of Vermont. (EV)

Minteer, Ben A., and Robert E. Manning. "Pragmatism in Environmental Ethics: Democracy, Pluralism, and the Management of Nature." Environmental Ethics 21(1999):191-207. A growing number of contributors to environmental philosophy are beginning to rethink the field's mission and practice. Noting that the emphasis of protracted conceptual battles over axiology may not get us very far in solving environmental problems, many environmental ethicists have begun to advocate a more pragmatic, pluralistic, and policy-based approach in philosophical discussions about human-nature relationships. In this paper, we argue for the legitimacy of this approach, stressing that public deliberation and debate over alternative environmental ethics is necessary for a culture of democracy to be upheld in decision making and policy formulation. Then we argue for a democratically tempered environmental ethics that is grounded in a practical understanding of the character of moral claims regarding the natural world. We offer the results of an empirical study of environmental ethics held by the public to illustrate the diversity in their moral commitments to nature. Finally, we conclude with a discussion of the implications of this ethical pluralism for policy discussions about the management of American public lands. (EE)

Minteer, Ben A., Elizabeth A. Corley, and Robert E. Manning, "Environmental Ethics Beyond Principle? The Case for a Pragmatic Contextualism," Journal of Agricultural and Environmental Ethics 17(2004):131-156. Many nonanthropocentric environmental ethicists subscribe to a "principle-ist" approach to moral argument, whereby specific natural resource and environmental policy judgments are deduced from the prior articulation of a general moral principle.

More often than not, this principle is one requiring the promotion of the intrinsic value of nonhuman nature. Yet there are several problems with this method of moral reasoning, including the short-circuiting of reflective inquiry and the disregard of the complex nature of specific environmental problems and policy arguments. In the present paper, we advance an alternative, pragmatic contextualist approach to environmental ethics, one grounded in the moral theory of John Dewey. We present the results of an empirical study of public environmental ethics and natural resource management attitudes to support our position, and we conclude with a few recommendations for future inquiry in the field of environmental ethics. Keywords: contextualism, empirical study, environmental ethics, pragmatism, public attitudes. Minteer, Ben A., "Environmental Philosophy and the Public Interest: A Pragmatic Reconciliation," Environmental Values 14(2005): 37-60. Most environmental philosophers have had little use for

'conventional'

philosophical and political thought. This is unfortunate, because these traditions can greatly contribute to environmental ethics and policy discussions. One mainstream concept of potential value for environmental philosophy is the notion of the public interest. Yet even though the public interest is widely acknowledged to be a powerful ethical standard in public affairs and public policy, there has been little agreement on its descriptive meaning. A particularly intriguing account of the concept in the literature, however, may be found in the work of the American pragmatist John Dewey. Dewey argued that the public interest was to be continuously constructed through the process of free, cooperative inquiry into the shared good of the democratic community. This Deweyan model of the public interest has much to offer environmental philosophers who are interested in making connections between normative arguments and environmental policy discourse, and it holds great promise for enhancing environmental philosophy's role and impact in public life. Minter, Ben A., and Elizabeth A. Corley, "Conservation or Preservation? A Qualitative Study of the Conceptual Foundations of Natural Resource Management," *Journal of Agricultural and Environmental Ethics* 20(2007):307-333. Few disputes in the annals of US environmentalism enjoy the pedigree of the conservation-preservation debate. Yet, although many scholars have written extensively on the meaning and history of conservation and preservation in American environmental thought and practice, the resonance of these concepts outside the academic literature has not been sufficiently examined. Given the significance of the ideals of conservation and preservation in the justification of environmental policy and management, however, we believe that a more detailed analysis of the real-world use and understanding of these ideas is needed. In this paper, we describe the results of a qualitative, semantic study of the concepts of conservation and preservation undertaken in the context of the Chattahoochee National Forest (CNF), located in northern Georgia (USA). Thirty in-depth interviews were conducted with scientists and north Georgia residents either interested or involved in the future management of the forest. Respondents were asked to define conservation and preservation in their own words and to indicate which approach they felt was more appropriate for the management of the CNF. Qualitative content analysis was used to elicit a set of recurring themes for each foundational concept. Taken together, these themes help to flesh out the meaning of conservation and preservation for citizens and scientists today, and illustrate the evolving nature of two of the more significant and venerable ideas animating US environmental policy and management.

Minter, Ben A. "Biocentric Farming? Liberty Hyde Bailey and *Environmental Ethics*." *Environmental Ethics* 30(2008):341-359. Most environmental ethicists adhere to a standard intellectual history of the field, one that explains and justifies the dominant commitments to nonanthropocentrism, moral dualism, and wilderness/wildlife preservation. Yet this narrative—which finds strong support in the work of first generation environmental historians—is at best incomplete. It has tended to ignore those philosophical projects and thinkers in the American environmental tradition that challenge the received history and the established conceptual categories and arguments of *Environmental Ethics*. One such figure is the agrarian thinker, conservationist, and rural reformer, Liberty Hyde Bailey. A writer whose environmental philosophy combined biocentric attitudes toward nature with more humanistic concerns about intergenerational fairness and civic responsibility, Bailey remains an invisible figure in *Environmental Ethics*, despite his clear influence on the later work of such conservation luminaries as Aldo Leopold, Wendell Berry, Wes Jackson, and others. We would benefit from a recovery of Bailey's environmental philosophy, especially his articulation of a pluralistic ethical outlook defined by the melding of anthropocentric moral and civic concerns with biocentric commitments regarding the beauty and resilience of the properly cultivated landscape. Mitcham, Carl, ed., Banchetti-Robino, Marina Paola, Marrietta, Jr., Don E., and Embree, Lester, guest eds., Research in Philosophy and Technology: Volume 18, Philosophies of the Environment and Technology. Stamford, Connecticut: JAI Press, 1999. 376pp. \$ 78, hardbound only. Expensive, but there is a lot in it. Only Parts I and II are relevant here.

Part I. Philosophies of the Environment and Technology

--Callicott, J. Baird, "After the Industrial Paradigm, What?," pp. 13-25. "A human economy shifting from industrial production and consumption of material objects to postindustrial production and consumption of information will be better adapted to the natural environment" (p. 25).

--Ihde, Don, "Phil-Tech Meets Eco-Phil: The Environment," pp. 27-38. The relationships between philosophy of technology and environmental philosophy, with the aim of redirecting concerns that should unite these two disciplines.

--Hickman, Larry, "Green Pragmatism: Reals Without Realism, Ideals Without Idealism," pp. 39-56. John Dewey's critique of technology sheds much light on some of the issues now debated within environmental philosophy. Dewey advanced a broad critique of technological culture, and was also an evolutionary naturalist who rejected the extremes of scientific realism on the one hand and romantic idealizations of nature on the other.

--Marietta, Don E., Jr., "Decisions Regarding Technology: The Human Factor," pp. 57-72. "We have good reasons for not using certain technologies, either because they are harmful to the natural environment for us to tolerate their use, or because they are harmful to humans, either individual humans or human groups" (p. 58).

--Casey, Timothy, "Architecture As Environmental Philosophy." "It is the built environment that establishes the cultural context within which utensils and tools are employed and nature is first uncovered." Using "architecture" in this broad sense, any kind of building by which humans open up places and situate themselves in their world, a people's architecture is "an ethos that establishes their place in the world. It is in such places that we first discover the environment and hence the 'place' of nature in our lives" (p. 74).

--Robino, (Banchetti-Robino), Marina Paola, "Hermeneutic Technics: The Case of Nuclear Reactors," pp. 85-94. "The purpose of this paper ... is ... to examine phenomenologically the nature of the relation between the operator of a nuclear reactor and the instruments through which this operator gains information about the nuclear pile by focusing specifically on what went wrong" (pp. 85-86).

--Frodeman, Robert, "The Rebirth of Gaia and the Closure of Homo Technologicus," pp. 95-113. "A geological reading of the close of modernity and the advent of a postmodern era, ... by tracing the changing relationship between technology and nature. Since the industrial revolution, geology has been predominantly an economic discipline, supplying the raw materials for a technological way of life. In the future, the central role of the earth sciences will be political, helping to define the limits that individuals and communities must live within in order to flourish. ... On this reading the earth sciences become narrative sciences." (p. 95).

--Embree, Lester, "Personal Environmental Phenomenology, or the Examination of Electric Vehicle Technology," pp. 115-130. The environmental case for electric vehicles, and the phenomenological justification for driving an electric vehicle.

--Ferré, Frederick, "On Matter and Machines: An Environmental Speculation," pp. 131-142. "'Materialism,' though avidly pursued, is yet widely subjected to scorn." Wherein lies the conflict? "The alienation between matter and spirit, matter and mind, matter and purpose, though a deep historical reality in our modern worldview, is not a theoretical necessity" (p. 113). "The matter with matter, as depicted in the dominant modern worldview and as incorporated in our culture's characteristic technologies, is that it leaves out too much that is important and true. It leaves out quality. It leaves out adventure. It leaves out society. It leaves out mind and purpose and value. But this need not be the case, and should not long

continue" (p. 141).

--Rolston, Holmes III, "A Managed Earth and the End of Nature?", pp. 143-164. Humans increasingly see themselves as the planetary managers, regionally if not globally. Perhaps nature is at an end? All culturally intended activity modifies spontaneous wild nature. Nature widely bears the marks of human transforming, although there remains also much relatively undisturbed nature. Some respond that evolutionary and ecosystemic natural history has been overtaken by human engineering. Others seek a revised account by which human activity is, or should be, natural. The idea(l) of nature, absent humans, ought to be replaced with an idea(l) in which the human presence is also natural. A postmodern claim is that humans have never known, and cannot know, nature as it is itself. Wild nature is ended, because we now know that nature always wears for us a human face. But nature neither is, or ought to be, ended. Although humans belong on Earth; we do not have and do not want an entirely managed, humanized nature. Nature ought also be an end in itself.

Part II. A Symposium on Michael Zimmerman's Contesting Earth's Future.

--Davion, Victoria, "Zimmerman on Feminism, Truth and Objectivity."

--Maskit, Jonathan, "'All in Post': On Michael Zimmermann's Contesting Earth's Future."

--Vogel, Steven, "On Michael Zimmerman's Contesting Earth's Future."

--Zimmerman, Michael E., "Recognizing the Limits of Contesting Earth's Future."

Mitchell, Lawrence E., Corporate Irresponsibility: America's Newest Export. New Haven: Yale University Press, 2001. U.S. law has frozen the business organization at a very early stage of moral development. Law encourages corporations to maximize stockholder profit and confines the major players--stockholders, managers and board members--to morally stunted roles in pursuit of this profit. Social good all too often fails before the desire for shareholder value. What corporations really need are knowledgeable investors who will tolerate and encourage the pursuit of long-term strategies that have no short-term profit payoff (which happens more often in Europe). But board members fester in a system that encourages them to stifle these larger fiduciary duties and long-term social interests. Alas, it is tough to fix this situation by giving executives more freedom and responsibility. Stockholders cannot ensure that the board members will not "self-deal"; corporate managers cannot protect themselves from the short-term greed of stockholders. And, with global capitalism, American is exporting this flawed system around the world. Needless to say, environmental protection and conservation is near the bottom of this agenda. Mitchell is a research professor at George Washington Law School. (v.13,#2)

Mitchell, Ross E. "Thorstein Veblen: Pioneer in Environmental Sociology", Organization and Environment 14 (No. 4, December 2001) pp.389-408. This article investigates the writings of American institutional economist Thorstein Bunde Veblen (1857-1929) on capitalism and environment. The two main queries concern (a) Veblen's stand on natural resource utilization as a consequence of capitalism and (b) its current relevance to environmental sociology. Veblen's theories of conspicuous consumption, absentee ownership, and natural resource exploitation are examined from several of his seminal contributions. The article concludes that Veblen's pioneering analysis of wasteful use of natural resources and emulative consumerism is essential to environmental sociology and timely because of current environmental crises. Future research is suggested in two areas: (a) applying Veblen's theoretical approaches to the ecological aspects of capitalism and (b) comparing Veblen with other classical theorists such as Marx and Weber within the subfield of environmental sociology. Mitchell is a PhD candidate in the Department of Rural Economy at the University of Alberta. (v.13,#2)

Mitchell, Timothy. "The Use of an Image: America's Egypt and the Development Industry." The Ecologist 26, no.1 (1996): 19. USAID and other development agencies typically portray Egypt as the narrow valley of the River Nile hemmed in by the desert and crowded with rapidly-multiplying millions of inhabitants, a picture which enables Egypt's poverty to be ascribed to demography and geography. Such an image obscures the political and social inequalities that underlie Egypt's inability to feed itself. It

also hides the role that USAID plays in the promotion of policies framed to support US domestic issues. (v7, #3)

Mitman, Gregg, The State of Nature: Ecology, Community, and American Social Thought, 1900-1950. Chicago: University of Chicago Press, 1992. 290 pages. \$ 23.50 paper. A study of the connection between liberal social thought and the concept of harmony in nature in the first half of the century. Social attitudes and commitments shaped ecological thinking, which in turn sought to influence social and political thinking. There were steady interactions between ecology and ecologists and ideas of social community and social forces. The cooperative view of nature eroded in the 1940's and 1950's due both to the modern Darwinian synthesis of evolution by natural selection, as well as through the association of organicism with totalitarian ideologies. Mitman is in the history of science at the University of Oklahoma. (v4,#2)

Mitra, Barun, "Selling the Tiger to Save It," New York Times, August 15, 2006. Op-ed. China has a few dozen tigers, staring at extinction. Of the planet's estimated 5,000 wild tigers, about 75% are in India. China has 4,000 in captivity. The U.S. has more tigers than anybody else, 10,000 in zoos and privately owned. China has followed a strict prohibition policy, trying to prevent poaching for the use of tiger parts in traditional medicine. Now China plans to establish more tiger-breeding facilities and see the tiger parts for medicinal use, to eliminate the incentive for poaching. Never mind that these treatments are worthless; you can make lots of money selling tigers. Mitra directs the Liberty Institute, a research organization that promotes free-market economics.

Mittelstrass, J., "Umwelt und Gesundheit: Von der Schwierigkeit, sich mit Umwelt- und Gesundheitsstandards in einer Kulture-Natur zurechtzufinden [Ethics of Environment and Health: On the Difficulty of Determining Environmental and Health Standards in a Cultural Nature]," in Wiener Klinische Wochenschrift 101 (no 17, 1989): 563-571. Scientific cultures, i.e. modern industrial societies, create their own environment. The expression denoting such a creation is a Kultur-Nature (cultural nature) determined by environmental and health standards. These standards are neither natural laws nor can they be derived from nature. They are instead a part of human rationality. They also have an ethical dimension. The argument focuses on the following aspects: scientific and technological rationality as problem solver and problem producer, exploration of the concept of the Kultur-Natur, the status of environmental and health standards, presenting the case for the concept of rational ethics (Vernunftethik) against the concept of ecological ethics and the supplementation of a research imperative by an ethical imperative. Mittelstrass is at the Zentrum Philosophie und Wissenschaft Theorie, University of Constance, Germany. (v2,#2)

Mizzoni, John, "Franciscan Biocentrism and the Franciscan Tradition," Ethics and the Environment 13(no. 1, 2008):121-134. Franciscan biocentrism is the view that Francis of Assisi is a biocentrist who holds that all living things have intrinsic value. Recently, biocentric theorists Sterba and Taylor have modified biocentrism to accommodate holistic entities. I consider thinkers from the broader Franciscan intellectual tradition (Bonaventure and Scotus) to see whether Franciscan biocentrism can be similarly modified. I discuss notions from these medieval philosophers such as the Cosmic Christ and the concept of haecceitas. I also explore whether Franciscan biocentrism can provide a satisfactory response to the problem of evil, since Franciscan biocentrism faces an issue that secular biocentrism does not: making sense of extinction. John Mizzoni is Associate Professor of Philosophy at Neumann College in Aston, PA.

Mizzoni, John. "St. Francis, Paul Taylor, and Franciscan Biocentrism." Environmental Ethics 26(2004):41-56. The biocentric outlook on nature affirms our fellowship with other living creatures and portrays human beings as members of the Earth's community who have equal moral standing with other living members of the community. A comparison of Paul Taylor's biocentric theory of environmental

ethics and the life and writings of St. Francis of Assisi reveals that Francis maintained a biocentric environmental ethic. This individualistic environmental ethic is grounded in biology and is unaffected by the paradigm shift in ecology in which nature is regarded as in flux rather than tending toward equilibrium. A holistic environmental ethic that accords moral standing to holistic entities (species, ecosystems, biotic communities) is more vulnerable to these changes in ecology than an environmental ethic that accords moral standing to individuals. Another strength of biocentrism is its potential to provide a unified front across religious and scientific lines. (EE)

Moberg, Gary P., "Using Risk Assessment to Define Domestic Animal Welfare", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. It is doubtful that there will ever be a universally acceptable definition of animal welfare, but I believe that it is possible to arrive at a working definition of what are acceptable practices for managing domestic animals by the use of risk assessment. Risk to an animal's welfare occurs when an animal experiences stress of such magnitude that there is a significant diversion of the animal's biological resources from normal function. This is the biological cost of stress. If the biological cost becomes great enough, the animal enters a prepathological state where it is vulnerable to disease, where it may no longer be able to reproduce, or where it may be unable to grow. These types of biological responses can be measured and, as a result, can in turn be used as measures of well-being. These measures of well-being can then be used to establish a scale of biological cost, providing us with a basis for using risk assessment to determine what management practices place a domestic animal's well-being at risk. Risk assessment makes it possible to evaluate domestic animal welfare under various management conditions, providing definitions of welfare that can be used to set legal guidelines for the care and use of domestic animals.

Moberg is with the Department of Animal Science, University of California, Davis.

Moffat, Anne Simon, "Resurgent Forests Can Be Greenhouse Gas Sponges," Science 277 (18 July, 1997):325-316. Recent evidence indicates that forests store much more carbon than had been thought. Some previous studies calculated that forests take up about as much carbon dioxide while photosynthesizing as they give off when respiring, resulting in little net carbon flow into or out of forests. But new results, some from re-analysis of the old data, indicates that forests and the carbon they sequester have been undervalued, especially the carbon in forest soils, much in peat, also much more than thought in tropical forests. Reforestation can be significant in offsetting industrial carbon. (v8,#3)

Moffat, Anne Simon, "Global Nitrogen Overload Problem Becomes Critical," Science 279(1998):988-989. Synthetic nitrogen, from fertilizers, is overloading many regional ecosystems. Though fixed nitrogen is essential for life, the added nitrogen is too much of a good thing. Human activities, mostly synthetic fertilizers, but also fossil fuel burning, especially in automobiles, produce 60% of all the fixed nitrogen deposited on land each year. The situation is changing quite rapidly. (v9,#1)

Moline, Jon N., "Aldo Leopold and the Moral Community," Environmental Ethics 8(1986):99-120. An important and original analysis of the central elements of Leopold's land ethic. Moline is interested in balancing ecosystemic holism with a concern for individual human rights. He argues that Leopold is an "indirect holist" who used ecological function as the value criterion for judging principles and rules, not individual acts in the environment. This interpretation of Leopold avoids the problems of extreme holism (loss of individual value autonomy) and extreme individualism (no value for species or systems). (Katz, Bibl # 1)

Moline, Jon N. "Aldo Leopold and the Moral Community." Environmental Ethics 8(1986):99-120. Aldo

Leopold's land ethic calls for an extension of ethical consideration to nonhuman components of the complex system he called "the land." Although the basis for this extension was holistic, interpretations of Leopold's holism leave one baffled at how he could see his land ethic as an extension of a system which recognizes individual human rights. Leopold's critics and exponents alike have focused on the holism expressed in his definition of right and wrong. Both regard it as a working criterion of morality to be applied directly to conduct, act by act. Both are mistaken. Leopold was an indirect holist, not a direct one. That is, he applied his holistic definition of right and wrong not as a rule for judging conduct directly, case by case, but as a principle for judging conduct only indirectly by judging the rules, tastes, predilections, practices, and attitudes which influence it. Moline is in the philosophy department, University of Wisconsin, Madison, WI. (EE)

Moll, Gary, and Sara Ebenreck, eds., Shading Our Cities: A Resource Guide for Urban and Community Forests. Washington, D.C: Island Press, 1989. Pp. xvii, 329. Published by the American Forestry Association, this a wide-ranging look at the role of trees in the urban landscape---i.e., in human life. Topics include a discussion of value (Sara Ebenreck, "The Values of Trees,"), the sense of "place," practical advice on citizen advocacy, and computer software. (Katz, Bibl # 2)

Moltmann, Jürgen, God in Creation: A New Theology of Creation and the Spirit of God. San Francisco: Harper and Row, 1985. Published in the U.K. as God in Creation: An Ecological Doctrine of Creation. London: SCM Press, 1985. A Biblical theology of creation, in marked contrast to key themes in Moltmann's previous work. A trinitarian, messianic, eschatological theology of creation oriented by the concept of the Sabbath as the goal of creation. In contrast to monotheistic theology, trinitarian theology supports relatedness, participation, and interpenetration, and emphasizes God's immanence in creation. An ecological theology will turn away from anthropocentrism for a cosmological theocentrism in which the Sabbath, not humanity, is the crown of creation. Humans are the crown of creation only in and as a community that is part of nature.

Moltmann, Jürgen, Wolterstorff, Nicholas, and Charry, Ellen T., A Passion for God's Reign: Theology, Christian Learning and the Christian Self. Edited by Miroslav Volf. Grand Rapids, MI: Erdmans, 1998. 112 pages. Of interest here because Moltmann, the celebrated German theologian, calls for "a new theological/ecological architecture wherein we will realize "it is not the human being that is the measure of all things, but rather God, who created all life" (p. 20). Moltmann foresees "an ecological culture" in the next century (p. 28). Only so can humankind and the Earth survive. (v.10,#1)

Monti, Michael J., Origin and Ordering: Aristotle, Heidegger, and the Production of Nature, 1997, State University of New York at Binghamton, Ph.D. thesis. 332 pages. Aristotle's concept of nature in the light of Martin Heidegger's critique of technological thinking and the influence his works have in environmental ethics. The "positive terminus" of Heidegger's critique of nature lies in the forgotten Greek understanding of nature as phusis, or self-emergence. Heidegger's lectures on Aristotle's Physics focus on nature's self-emergence. Aristotle conceives nature without imposing anthropocentric models of artistic production. Moving beyond Heidegger, Monti argues that Aristotle's teleological understanding of natural production reveals nature as a source of intrinsic good. But Aristotle also has important and uncomfortable limits, seen in his concept of species; and ecology attempts to expand our understanding of nature's intrinsic good. One can make provisional links between Aristotle's understanding of self-emergence and Heidegger's attempts at providing a post-technological way of relating to the natural world, which he calls "dwelling." The advisor was Stephen David Ross. (v.10,#1)

Over the past few years, a spate of mergers and takeovers among mining multinationals has enabled them to take maximum advantage of national mining assets being privatized worldwide. British company Rio Tinto Zinc is foremost among these global giants, its position resulting in large part from its self-serving, global political infrastructure. (v7,#2)

Moon, Bruce E.. Dilemmas of International Trade. Boulder, CO: Westview Press, 1996. 192 pages. \$49.95 hb, \$14.95 pb. In the post-Cold War world, trade is the new arena for competition--between nations, between groups, between ethical and theoretical ideas. Political economist Bruce Moon puts contemporary trade events--NAFTA, United States-Japan controversies, the Uruguay Round of GATT, China's Most Favored Nation status, the founding of the World Trade Organization--into historical and theoretical perspective with the British Corn Laws, the Great Depression, the Bretton Woods system, and the origins of the European Union. Economic theory, terms, and concepts are explained and contextualized with those from international relations. Three central dilemmas are examined: the unequal distribution of income and wealth created by international trade, the tradeoff among competing values that trade requires, and the difficult interrelationship between economic and foreign policy goals within and among trading nations. Though internationally framed, each dilemma has ramifications at a variety of levels all the way down to the individual's role in the global economy--as a consumer, as a citizen, and ultimately as a moral agent. Bruce E. Moon is professor of International Relations at Lehigh University. (v7,#1)

Moore, Eric. "The Case for Unequal Animal Rights." I argue that the equal rights views of Tom Regan and Evelyn B. Pluhar must be rejected because they have unacceptable consequences. My objection is similar to one made in the literature by Mary Anne Warren, but I develop it in more detail and defend it from several plausible responses that an equal rights theorist might make. I formulate a theory, a moderate form of perfectionism, that makes a value distinction between moral agents and moral patients according to which although both have rights, these rights are not equal. This theory avoids the unacceptable consequences of the equal rights view and is immune to the marginal cases arguments that typical full-personhood theories succumb to. This moderate perfectionism generates an obligation for people to be vegetarians (in most cases) and to severely curtail animal experimentation. Environmental Ethics 24(2002):295-312. Moore, Jason W., "The Crisis of Feudalism: An Environmental History", Organization and Environment, 15, (No. 3, 2002): 301-22. Environmental history may help explain feudalism's demise and capitalism's

ascent in the 16th century. Medieval Europe was riven by profound socio-ecological contradictions. Feudalism's environmental degradation pivoted on the lord-peasant relationship, which limited the possibilities for reinvestment in the land. Consequently, feudalism exhausted the soil and the labour power from which it derived revenues, rendering the population vulnerable to disease. The Black Death decisively altered labour-land ratios in favour of Western Europe's peasantry. This new balance of class forces eliminated the possibility of feudal restoration and led the states, landlords and merchants to favour geographical expansion – an external rather than internal spatial fix to feudal crisis. This external fix, beginning in the Atlantic world, had capitalist commodity production and exchange inscribed within it. Capitalism differed radically from feudalism in that where earlier ecological crises had been local, capitalism globalized them. From this standpoint, the origins of capitalism may shed light on today's ecological crises. Moore is a world historian and graduate student at the Department of Geography, University of California, Berkeley. (v.13, #3)

Moore, Jason W. Review of John Bellamy Foster, "Marx's Ecology: Materialism and Nature", Organization and Environment 14 (No. 2, June 2001) pp. 240-45. Moore is a world historian and a graduate student in the department of geography at the University of California at Berkeley. (v.13,#2)

Moore, Jonathan W., "Animal Ecosystem Engineers in Streams," BioScience 56 (no.3, March 2006): 237-246 (10). An impressive array of animals function as ecosystem engineers in streams through a variety of activities, ranging from nest digging by anadromous salmon to benthic foraging by South American fishes, from the burrowing of aquatic insects to the trampling of hippos. Because ecosystem engineers can profoundly affect stream ecosystems, and because they themselves can be significantly affected by human activities, understanding ecosystem engineering in streams is increasingly important for the management of these ecosystems.

Moore, Kathleen Dean, "(Over)Stories: Examining the Philosophical Assumptions Behind Intensively Managed Forest Plantations," Journal of Forestry 103(no.2, March 2005):97-98(2).

Moore, Kathleen Dean, Holdfast: At Home in the Natural World. New York: The Lyons Press, 1999. "We professors, who should be studying connection, study distinctions instead. In white laboratories, biologists find it easy to forget that they are natural philosophers. Philosophers, for their part, pluck ideas out of contexts like worms out of holes, and hold them dangling and drying in bright light. When people lock themselves in their houses at night and seal the windows shut to keep out storms, it is possible to forget, sometimes for years and years, that human beings are part of the natural world. We are only reminded, if we are reminded at all, by a sadness we can't explain and a longing for a place that feels like home. Sitting on a boulder whitewashed by western gulls, watching the sliding surf, I resolve to study holdfasts" (rootlike structures of algae for attachment to the substrate). Moore is in philosophy at Oregon State University. (v.11,#3)

Moore, Kathleen Dean. "The Truth of the Barnacles: Rachel Carson and the Moral Significance of Wonder." Environmental Ethics 27 (2005):265-277. Beginning with Rachel Carson's small book, *The Sense of Wonder*, I explore the moral significance of a sense of wonder—the propensity to respond with delight, awe, or yearning to what is beautiful and mysterious in the natural world when it unexpectedly reveals itself. An antidote to the view that the elements of the natural world are commodities to be disdained or destroyed, a sense of wonder leads us to celebrate and honor the more-than-human world, to care for it, to protect its thriving. If this is so, then a sense of wonder may be a virtue, perhaps a keystone virtue in our time of reckless destruction, a source of decency and hope and restraint. (EE)

Moore, Kathleen Dean, Riverwalking. New York: Lyons and Burford Publishing, 1995. 164 pages. Building around the metaphors of rivers, symbolizing the flow of life, Moore finds that lives "come together on rivers, where biology and philosophy, body and mind, experience and idea, flow side by side until they cannot be distinguished in a landscape that is whole and beautiful and ambiguous." Reflections on her experiences over the years in and around rivers. With excellent notice in the New York Times Magazine and the Chronicle of Higher Education. Moore is in philosophy at Oregon State University. (v6,#4)

Moore, Mary Elizabeth, Ministering with the Earth. St. Louis, MO: Chalice Press, 1998. 226 pages. Moore is fond of the metaphor, suitably pastoral and feminist of ministering as "quilting a life in relation to God and God's creation." A collection of insightful stories, episodes, thoughts, sermonettes, pastoral ideas and opportunities. Examples: Stephen R. L. Clark's complaints about ecological theology, planting trees at Claremont, aboriginal peoples, St. Francis. A plea for caring whether human interactions complement or disrupt earth's processes. Moore is professor of theology and Christian education at Claremont School of Theology. (v10,#4)

Moore, Peter D., "The Exploitation of Forests," Science and Christian Belief (Exeter: Paternoster Press) 2(1990):131-140. The disharmony between humans and the natural world is nowhere better illustrated than in the study of forest ecosystems. Since prehistoric times the removal of forest cover in temperate areas has led to retrogressive practices in vegetation and this form of destruction is now accelerating in the tropics, possibly creating global problems. The stewardship demanded of Christians in Genesis requires that Christians seek alternative ways of deriving sustenance from the forests, using sustainable harvesting. Peter Moore is an ecologist in the Division of Biosphere Sciences, King's College, London. (v2,#3)

Moore, Ronald. *Natural Beauty: A Theory of Aesthetics Beyond the Arts*. Peterborough, Ontario: Broadview Press, 2008. Moore presents a new philosophical account of the principles involved in making aesthetic judgments about natural objects. He weaves historical and modern accounts of natural beauty into a "syncretic theory" that centers on key features of aesthetic experience - specifically features that sustain and reward attention. In this way, Moore claims to set his account apart from both the purely cognitive and purely emotive approaches that have dominated natural aesthetics. Moore tries to show why the aesthetic appreciation of works of art and the aesthetic appreciation of nature can be mutually reinforcing and cooperative rather than rival. He also argues for how the experience of natural beauty can contribute to the larger project of living a good life.

Morell, Virginia. "Can the Wild Tiger Survive?" Science Vol. 317, no. 5843 (7 September 2007): 1312-14. Wild tigers are on the verge of extinction in most of Asia, and perhaps 3,000 remain, reduced from 100,000 a century back. There are perhaps stable populations only in Nepal and Bangladesh. There are some 11,000 in captivity, often genetically depauperate. China is advocating reintroducing tigers into the wild from its breeding centers, but critics doubt the wisdom of this, doubting the genetic integrity of the captive tigers, and arguing that habitat loss and poaching is the main issue.

Morgan, J. Mark, "Resources, Recreationists, and Revenues: A Policy Dilemma for Today's State Park Systems," Environmental Ethics 18(1996):279-290. Many state park systems across the U.S. are facing a controversial policy issue over the three R's: resources, recreationists, and revenues. It is becoming increasingly difficult for state parks to protect the resources and allow for public enjoyment, mainly because of political demands for increased revenue. As a result, many state park systems have built elaborate facilities for visitors. Are these park improvement projects motivated by a sincere desire to satisfy diverse user groups or simply another way of generating revenue for state governments? What are the 'hidden' costs of park development? I discuss the policy implications for state park management, along with some philosophical issues concerning the utilization of publicly owned natural resources. Morgan is in Horticulture, Forestry and Recreation Resources, Kansas State University. (EE)

Morgan, Paul A., and Scott J. Peters, "The Foundations of Planetary Agrarianism. Thomas Berry and Liberty Hyde Bailey," Journal of Agricultural and Environmental Ethics 19(2006):443-468. The challenge of pursuing sustainability in agriculture is often viewed as mainly or wholly technical in nature, requiring the reform of farming methods and the development and adoption of alternative technologies. Likewise, the purpose of sustainability is frequently cast in utilitarian terms, as a means of protecting a valuable resource (i.e., soil) and of satisfying market demands for healthy, tasty food. Paul B. Thompson has argued that the embrace of these views by many in the consumer/environmental movement enables easy co-optation by agribusiness. It also reflects a critical weakness in this movement: a lack of commitment to philosophical principles that depart from the utilitarian premises of the industrial model of agriculture. This paper draws on the writings of Thomas Berry and Liberty Hyde Bailey to identify the philosophical principles of what we call planetary agrarianism. From the perspective of planetary agrarianism, the pursuit of sustainability is a broad and challenging moral, educational, and political task. Berry helps us see that it is fundamentally a project of worldview transition, which requires a new cultural narrative that must rival, in form and appeal, the mythic power of the utilitarian industrial vision. Liberty Hyde Bailey, author of The Holy Earth (1915) and a leader in the land-grant education and nature-study movements, took up the project of worldview transition in his life work. While in some ways dated and flawed, Bailey's writings are a valuable source of guidance for developing and pursuing a viable philosophy of agriculture for the 21st century. Keywords: agrarian philosophy - agricultural ethics - Darwinism - land-grant education - Liberty Hyde Bailey - sustainable agriculture - Thomas Berry - US agricultural history - worldview transition.

Moriarty, Paul Veatch and Mark Woods. "Hunting [does not equal] Predation." Environmental Ethics 19(1997):391-404. Holmes Rolston has defended certain forms of hunting and meat eating when these activities are seen as natural participation in the food chains in which we evolved. Ned Hettinger has suggested that some of Rolston's principles that govern our interactions with plants and animals might appear to be inconsistent with Rolston's defense of these activities. Hettinger attempts to show that they are not. We argue that Rolston's principles are not consistent with hunting, given Hettinger's modifications. In his defense of Rolston, Hettinger has challenged animal welfare ethicists to show that they can value animal predation while consistently condemning human hunting. We answer that hunting and meat eating by humans are "cultural" rather than "natural" activities. Moriarty teaches philosophy at Longwood College, Farmville, VA. Wood is in philosophy at the University of San Diego, CA. (EE)

Moriarty, Paul Veatch, Animal Cognition and Self-Awareness (Cognitive Ethology), 1997, University of Colorado, Boulder, Ph.D. thesis, Department of Philosophy. Most cognitive psychologists see no reason to suppose that animals are aware of their own thoughts; many philosophers view self-awareness as being fundamental to our humanity, making self-awareness a dividing line between humans and (other) animals. But there is empirical evidence that some animals are self-aware, and this has profound implications for moral duties toward animals. Self-awareness comes in degrees, and varies along three independent axes: complexity of self-concept, properties attributed to the self, and degree of awareness. Mirror-self-recognition experiments provide only a limited evidence that does not bear moral weight. Animal communication provides evidence that some animals are aware of their own mental states. One result of the study is to see how the human mind fits into the natural world. The thesis advisor was Dale Jamieson. Moriarty is now teaching philosophy at Longwood College, Farmville, Virginia. Morito, Bruce, "Intrinsic Value: A Modern Albatross for the Ecological Approach," *Environmental Values* 12(2003): 317-336. The idea and use of the concept of intrinsic value in environmental ethics has spawned much debate in environmental ethics/axiology. Although for many, it seems fundamental and necessary for formulating an ethic for environmental protection, it seems to confuse and even undermine such efforts. 'Intrinsic value' is, I argue, a concept born in the Western intellectual tradition for purposes of insulating and isolating those to whom intrinsic value can be attributed from one another and their environmental context. This is especially true from the Modern period onward. When used as a basis for determining moral considerability, these Modern foundations engender contradictory and self-defeating ways of thinking about the individual/ecosystem relationship. As a result, formulations of moral sensibilities and principles become self-defeating and, vis-a-vis the ecological context, incoherent. On the critique of this Modern residue, an alternative axiological framework is built, using Anthony Weston's idea of interdependent values as a preparation for a more ecologically coherent approach to environmental protection. This approach is dialectical and attempts to formulate an ecological foundation for moral considerability. (EV)

Morito, Bruce, *Thinking Ecologically: Environmental Thought, Values and Policy*. Halifax, N.S., Canada: Fernwood Publishing, 2002. C\$27.95. Foundations in metaphysics, epistemology, and axiology for developing an "ethic of attunement." A sustained argument for a shift to an ecological paradigm and how this can be carried out in a rational and systematic manner by using major historical shifts in world view as models. How dominant Western traditions have valued the environment and understood values. With a focus on axiology and the ethics of attunement, Morito builds on ideas that remain inchoate in Holmes Rolston III's work, especially his ideas about following nature. A policy section applies these concepts to sustainability and conservation. Morito is in philosophy, Athabasca University, Athabasca, Alberta, CA.

Morito, Bruce. "Language, Sustainable Development, and Indigenous Peoples: An Ethical Perspective." *Ethics and the Environment* 5(2000):47--60.

ABSTRACT: Holistic language has been employed as little more than an honorific in environmental policy formulations guided by the principle of sustainable development. In preambles of sustainable development documents, holistic language has been used to underscore the imperative of preserving ecosystem integrity and acknowledging our dependency on these systems. It has also been used to call attention to the need for a new framework of policy making, a change in direction that has been recognized as necessary for formulating environmentally sound policy. Part of this new framework involves questioning traditional concepts of the human agent and value assumptions. Yet holistic principles play virtually no substantive role in the formulation of policy. The outcome of this omission is that holism has been co-opted, rather than incorporated into sustainable development initiatives. A practical consequence of this move is that some subscribers to sustainable development principles have their values and perspectives co-opted, rather than incorporated, since the analytical system through which problems are identified and solutions developed is determined by a dominant sector of society, not by a holistic understanding of society. Aboriginal peoples have been among those whose values and perspectives have been co-opted. In 1990, I argued this discrepancy allowed holistic language to be used as a motivating device for soliciting subscribers, but had nothing to do with actual policy. Today, the problem has deepened as sustainable development has become more ubiquitous and influential. I will try to show how sustainable development deeply entrenches a tolerance for contradiction, which in turn

engenders a co-opting of Aboriginal perspectives and values by those subscribing to the dominant economic (E&E)

Morito, Bruce. "Examining Ecosystem Integrity as a Primary Mode of Recognizing the Autonomy of Nature." *Environmental Ethics* 21(1999):59-73. Attempts to come to grips with what appears to be the autonomy of nature have developed into several schools of thought. Among the most influential of these schools is the ecosystem integrity approach to environmental ethics, management and policy. The philosophical arm of the approach has been spearheaded by Laura Westra and her work in *An Environmental Proposal for Ethics*. The emphasis that this school places on pristine wilderness to model ecosystem integrity and the arguments Westra devises to justify the application of what she calls the "principle of integrity," although clear in its goal and object of inquiry, could very well retrench dualistic thinking of the sort that environmental thinkers have been trying to undermine. More importantly, I argue that Westra misses an important implication for the way in which ecosystem integrity could be used to help develop an ethic not so confined by problems of justification in attaching values to facts and descriptions to prescriptions. (EE)

Morito, Bruce. "Value, Metaphysics, and Anthropocentrism," *Environmental Values* 4(1995):31-47. The lack of metaphysical grounding of environmental values, and impatience towards the enterprise of seeking such grounding, result in a superficial and wrongheaded view of anthropocentrism. Anthropocentrism is best understood as a limiting condition, a point from which we can begin to reformulate an understanding of ourselves, our values, and our relation to the environment. It is not principally a starting point for the existence of values, as is assumed under traditional theories of anthropocentrism. To demonstrate and elaborate on this position, the paper focuses on environmental values and how we traditionally assume them to be formed and legitimated. A critique of the analyses of two prominent figures in the field of environmental ethics, Bryan Norton and Eugene Hargrove, serves as the backdrop against which an alternative view is formed. This alternative is metaphysically grounded in an ecologically informed analysis of valuational activity. Against the tradition, the argument establishes two main points: 1) that attempts to ground environmental values on human preferences, agreements, traditions, or culturally driven commitments are liable to legitimate contrary values; and 2) that an ecologically driven analysis of values shows that valuations of the environment are not fundamentally conferred onto it by human beings. Positively, the paper attempts to show that our inclusion as members of the ecological community makes our valuational activity an integral and transformational element within more comprehensive ecological processes. As such, our moral commitment to the environment must be radically reshaped in order adequately to incorporate this renewed understanding. KEYWORDS: Ecology, legitimation, moral failure, preference, preservation, triangular value relation, value conferring. Morito is in the philosophy department, University of Guelph. (EV)

Morowitz, Harold J., "Balancing Species Preservation and Economic Considerations," *Science*, August 16, 1991, "Once the term 'value' is introduced, the question moves to economics and ethics, both of which use that construct, but in very different senses. From a narrow economic point of view, we need a monetary metric of a species value to balance benefits against costs of preservation. View from

environmental ethics no such direct measure is possible." (v2,#3)

Morrell, Virginia. "Wolves at the Door of a More Dangerous World." *Science* Vol. 319, no. 5865 (15 February 2008): 890-92. As wolves were about to be delisted as endangered species, there was considerable controversy among biologists over whether the delisting was premature. A major concern was that this returned management to state levels and required each of the states (Idaho, Wyoming, Montana) to maintain a population of 100 wolves and 10 breeding pairs. This could mean a minimum population of 300 wolves, contrasted with the present recovered population of 1,500 wolves.

Morrell, Virginia. "Into the Wild: Reintroduced Animals Face Daunting Odds." *Science* Vol. 320, no. 5877 (9 May 2008): 742-43. Conservation biologists reintroducing wildlife battle hawks, habitat loss, and poachers to give animals a second chance. They often have a technical strategy, a scientific strategy, and a socioeconomic strategy, but find that the animals have a mind of their own. Less than half of reintroduction projects are successful; but there are notable successes, and biologists are resolute.

Morrill, R., "Inequalities of Power, Costs and Benefits across Geographic Scales: The Hanford (Washington) Reservation," *Political Geography* 18(1999):1-23. How federal mandates dominate a land-use decision; Morrill thinks that regional and federal governments and metropolitan intellectual and political elites push their agenda over the needs and desires of rural, small-town residents and their local governments. One such imposed agenda is making Hanford (long a nuclear site) into a wildlife reservation. But commentators think otherwise, especially:

-Martin, Deborah G., "Transcending the Fixity of Jurisdictional Scale," *Political Geography* 18(1999):33-38. Governments are fixed by scale but the other actors have interests fluid across many scales. Environmentalists with interests at stake in Hanford as a wildlife reservation are both local and regional, federal and state. Analysis of land-use conflicts must examine the power struggles and cross-scale alliances of multiple interests and social identities.

Morris, Carol, and Wragg, Amanda, "Talking about the Birds and the Bees: Biodiversity Claims Making at the Local Level," *Environmental Values* 12(2003): 71-90. This paper adopts a social constructionist perspective to examine how the biodiversity 'claim' is constructed and contested at local level. A framework is deployed which is based on Hannigan's (1995) ideas that certain factors need to be present for an environmental claim to be legitimised within the international arena (i.e. scientific authority; popularisers; media coverage; symbolic and visual dramatisation; economic incentives and institutional sponsorship). Empirical research into the production and implementation of Oxfordshire's Biodiversity Action Plan and Farm Biodiversity Action Plans in England and Scotland is used as a vehicle to explore the legitimisation of the biodiversity claim at the local scale. The two strands of research highlight the current importance of biodiversity as a focus for environmental planning partnerships (although the extent of public 'buy-in' to the claim is unclear) and the way in which biodiversity as a 'buzzword' has been adopted by farmers with some reluctance and mainly for financial reasons. There is strong evidence that the scientific basis of the claim is crucial in terms of engendering support, and that the rhetoric employed at the local level is positive rather than a 'rhetoric of loss'. However, the need for further popularisation of the biodiversity issue is identified. Potential future lines of research enquiry are also outlined. (EV)

Morris, Douglas D. "Alabama-Tombigbee Rivers Coalition v. Department of Interior: Giving Sabers to a 'Toothless Tiger,' the Federal Advisory Committee Act." *Environmental Law* 26, no.1 (1996): 393. Morris critiques the Eleventh Circuit's decision in Alabama-Tombigbee Rivers Coalition v. Department of

Interior. With a review of the Federal Advisory Committee Act and the law of injunctions, Morris concludes that the court erred in enjoining agency consideration of information submitted by a committee that had acted in violation of FACA. (v7, #3)

Morris, M. C., and Weaver, S. A., "Minimizing harm in agricultural animal experiments in New Zealand," Journal of Agricultural and Environmental Ethics 16(2003):421-437. Intrusive agricultural experiments published in New Zealand in the last five years are reviewed in terms of the degree of animal suffering involved, and the necessity for this suffering in relation to research findings. When measured against animal welfare criteria of the Ministry of Agriculture, thirty-six studies inflicted "severe" or "very severe" suffering. Many of these experiments had questionable short-term applications, had an application restricted to agricultural production or economic growth, or could have been modified to prevent or reduce suffering. KEY WORDS: animal ethics committees, animal welfare, New Zealand. (JAEE)

Morris, Mary Hallock. "The Political Strategies of Winning and Losing Coalitions: Agricultural and Environmental Groups in the Debate over Hypoxia." *Politics & Policy*, Vol. 35, no. 4 (2007): 836-71. This article presents a new typology that can be used to assess the political strategies used by winners and losers, ranging from mobilization to venue shifts and issue framing, of the debate over the dead zone of the Gulf of Mexico.

Morris, Mary Hallock. "The Political Strategies of Winning and Losing Coalitions: Agricultural and Environmental Groups in the Debate over Hypoxia." *Politics & Policy*, Vol. 35, no. 4 (2007): 836-71. This article presents a new typology that can be used to assess the political strategies used by winners and losers, ranging from mobilization to venue shifts and issue framing, of the debate over the dead zone of the Gulf of Mexico.

Morris, Michael C., "Issues associated with research on sheep parasite control in New Zealand - A descriptive ethic," Journal of Agricultural and Environmental Ethics 16(2003):187-207. New Zealanders generally oppose the use of animal experimentation where there is no demonstrable and immediate benefit for human, animal, or environmental health. Intrusive experiments on sheep internal and external parasites published between 1996 and 2000 are reviewed, and discussed in relation to these public sensibilities. All the experiments reviewed would be unacceptable according to the orthodox morality of the general public. Breeding programs, rotation of grazing, "low-tech" vaccination, and in vitro models of sheep can provide insights into preventing parasite infestation without intrusive experiments. Possible changes in New Zealand animal welfare legislation and its interpretation by Animal Ethics Committees are discussed. KEY WORDS: Animal Ethics Committees, flystrike, nematodes, parasites, sheep. (JAEE)

Morris, Michael C., and Weaver, Sean A., "Minimizing harm in possum control operations and experiments in New Zealand," Journal of Agricultural and Environmental Ethics 16(2003):367-385. Pest control operations and experimentation on sentient animals such as the brushtail possum can cause unnecessary and avoidable suffering in the animal subjects. Minimizing animal suffering is an animal welfare goal and can be used as a guide in the design and execution of animal experimentation and pest control operations.

The public has little sympathy for the possum, which can cause widespread environmental damage, but does believe that control should be as painless as possible. KEY WORDS: bovine tuberculosis, immunocontraception, New Zealand, pest control, possum, Trichosurus vulpecula. (JAEE)

Morris, Michael C., "The ethics and politics of the caged layer hen debate in New Zealand," Journal of Agricultural and Environmental Ethics 19(2006):495-514. Changes in attitudes toward animal welfare, with a greater emphasis on the importance of allowing animals to express normal patterns of behavior has led to an examination of the practice of keeping hens in battery cages. There is widespread scientific consensus that the conditions of confinement and the barren nature of battery cages severely restrict hens' behavioral repertoire, and are thus detrimental to their welfare. The New Zealand Animal Welfare Act 1999, stipulates that animals must have "the opportunity to display normal patterns of behaviour." In spite of this provision, the New Zealand government has not acted in phasing out battery cages, arguing instead that there is insufficient evidence that welfare will be improved by a phase-out. There is evidence of strong industry pressure on the government, and the use of tactics common in policy considerations where changes are resisted by powerful interests. It is important that policy processes are better managed so that welfare changes are based on both public preferences and scientific knowledge, and ways of doing this are discussed. Keywords: animal welfare - layer hens - New Zealand. Morris lives in Karori, Wellington, New Zealand. (JAEE)

Morris, Simon Conway, "Evolution: Bringing Molecules into the Fold," Cell 100(2000):1-11. Earth has evolved startling diversity of life, but this biodiversity is, in molecular terms, little more than skin deep. Most, perhaps all, of the basic building blocks necessary for organismal complexity were available long before the emergence of multicellularity. How and when the gene networks and regulatory mechanisms that led to complex organs and functioning organisms were assembled is largely obscure. Co-option of previous genes and products to novel and more complex functions is common, but unpredictable. Just as the phenotypic diversity of life excites the inspiration of a naturalist, so the range of molecules and the sophistication of their biochemistries impress the molecular biologist. We little understand the underlying constraints on form and whether and how far convergences are inevitable.

Biologists shy away from such studies for two reasons. (1) If evolution is in some sense channeled, then this reopens the controversial prospect of a teleology. The constrained and inevitable process is underpinned by a purpose, a sort of biological Anthropic Principle, which broadly sets boundary conditions for evolutionary history. (2) The study of evolution is strongly historical, and the prospect of a seemingly unique trajectory of circumstances for the history of life may be discouraging to those who are seeking general principles. Here convergences may be more common and more determinative than suspected; different genetic origins produce a similar complex result. The central conundrum of evolution is: how do we balance the process of change against the emergence of form. Conway Morris is a well-known paleontologist at Cambridge University, and this is an invited "millennium review" of the field. (v.13,#4)

Morrison, Keith, "Wilderness as the Kingdom of God," Ecotheology Vol 6 (Jul 01/Jan 02):23-41. morrison@lincoln.ac.nz The Eastern Orthodox Christian tradition has a spirituality that gives rise to ecotheological reflections. The reflections are couched in existential terminology describing mystical experience as well as historical and ecological praxis. The reflections have a realist theology of the Body of Christ considered to comprise the heavenly or uncreated, and the earthly or created.

The ecotheology developed in this paper interprets a realist theology of the Body of Christ through phenomenology and systems theory in an attempt to face the contemporary concrete issues of institutionalized materialism and severe environmental and social crises. Cross-traditional insights with Mahayana Buddhist traditions are commented upon in exploration of the challenges and opportunities of interculturalism and religious pluralism. The central thread in the paper is the contemporary symbol

wilderness, exploring how it is very effective in providing an image of community that to some speaks louder than kingdom. Further, the inherent relationships between the derivatives 'wild', 'wildness' and 'wilderness' are shown to reflect the paradoxical dynamics of the realist ecotheology developed. Paradoxical links are teased out between the material and spiritual, and also between the individual body and the cosmic body.

Morrison, Micah, Fire in Paradise: The Yellowstone Fires and the Politics of Environmentalism. New York: HarperCollins, 1993. The ecosystem paradigm has become a quasi-mystical idea, shifting out of the realm of rigorous scientific inquiry and into our culture without serious challenge, promoted by environmentalists as a religion. In 1988, Yellowstone paid the price for ecosystem management as fires played out their "naturally regulating" role in the ecosystem. The blazes eventually covered 1.2 million acres, cost the taxpayer \$ 120 million, and led to three deaths. We must begin redefining the ecosystem paradigm, arguing for mankind's [sic] proper role as a wise steward of the land, not as an enemy of its "natural functions." And part of wise stewardship means sometimes protecting the forest from its natural enemy, fire. Wise use also means ruling in favor of jobs over spotted owls in the Pacific Northwest, and in favor of middle-class development over gnatcatching birds in Southern California. Morrison finds Alston Chase a role model. Morrison is senior editor of Insight magazine. (v4,#2)

Morrison, Reg, The Spirit in the Genes: Humanity's Proud Illusion and the Laws of Nature. Ithaca, NY: Cornell University Press, 1999. Humans are the worst "plague mammal" (p. 96-98). Our illusory belief in human superiority and invincibility leads us to overpopulate the Earth, resulting in wanton habitat destruction throughout the glorious nonhuman world. Human growth, pursuing humans' self interest, often escalated and justified by religious motivations, causes repeated environmental disasters. Humans are unable to be concerned with their long term self-interest. Our painful ascent to civilization has been a plague on the Earth. "We conveniently contend that we alone of all earth's species are not normal animals, an extraordinary claim that demands extraordinary proof. And none exists. Not the slightest scrap of hard evidence, either morphological or genetic, exists to suggest that Homo sapiens is not, like all other animals, a natural product of evolution. ... The only irrefutable argument in favor of humanity's specialness is in fact purely mystical--and entirely circular. The myth lives on" (pp. xiii-xiv). (One might wonder whether such an animal, alone among all other species, operating with a view of its superiority that comes to jeopardize the planet, isn't some scrap of evidence of being special.)

Morton, Adam, "A Note on Comparing Death and Pain", Bioethics, 2 (1988): 129-35. The purpose of this note is to describe a way in which pain and death can be used to explore the evils befalling individuals of different species. It follows that the death of an animal of one species can be compared to that of another, in terms of their different relations to comparable amounts of pain. Thus, pain is used as the common currency in comparing rather different evils in different species.

Morton, Oliver, "Is the Earth Alive?" Discover, October 1999, pp. 96-101. Profile of James Lovelock, and an update on the Gaia hypothesis. Lovelock, speaking at a recent Oxford conference: "Gaia is a theory of science and is therefore always provisional and evolving. It is never dogmatic or certain and could even be wrong. Provisional it may be but, being of the palpable Earth, it is something tangible to love and fear and think we understand. We can put our trust, even faith, in Gaia, and this is different from the cold certainty of purposeless atheism or an unwavering belief in God's purpose. ... I have put before you the proposition that Gaia, in addition to being a theory in science, offers a world view for agnostics. This would require an interactive trust in Gaia, not blind faith. A trust that accepts that, like us, Gaia has a finite life span and is provisional" (p. 102). (v.11,#1)

<http://www.nytimes.com/2009/09/19/automobiles/19CARS.html>

The European Union, in a mandate known as the End-of-Life Vehicles Directive, will require 85% of a car's materials, by weight, to be recovered and reused. In 2007, networks set up by carmakers in the European Union must be ready to accept all scrap vehicles, regardless of age, at no cost to the car's last owner. In 2015, the portion of each vehicle that should be recycled increases to 95%. The 2007 Mercedes-Benz S-Class sedan, shown recently at a Frankfurt auto show, already complies with the 2015 regulation. Honda Motors Europe is planning how to take back, over the next few years, over half a million vehicles. The U.S. has such recycling nowhere on its agenda, relying largely on voluntary compliance, market-based approaches, disliking "command and control" solutions, also claiming to have amply landfill space, unlike Europe.

Mueller, Frank G. "Does the Convention on Biodiversity Safeguard Biological Diversity?" Environmental Values 9(2000):55-80. Abstract:

This paper attempts to assess and evaluate some of the economic implications of the Convention on Biological Diversity. After outlining the main principles and the scope of this Convention, the following issues are addressed: the determination of the 'optimal' level of biodiversity loss, the meaning of incremental costs, and monetary evaluation problems of ecological resources and the problems it poses for the funding mechanism (GEF). The paper concludes with a discussion of the issues of commercialisation and access to genetic resources.

Keywords: Ecological economics, biological diversity, monetary evaluation, commercialisation. Mueller is in the Department of Economics

Munda, Giuseppe, "Environmental Economics, Ecological Economics, and the Concept of Sustainable Development," Environmental Values 6(1997):213-233. ABSTRACT: This paper presents a systematic discussion, mainly for non-economists, on economic approaches to the concept of sustainable development. As a first step, the concept of sustainability is extensively discussed. As a second step, the argument that it is not possible to consider sustainability only from an economic or ecological point of view is defended. Issues such as economic-ecological integration, inter-generational and intra-generational equity are considered of fundamental importance. Two different economic approaches to environmental issues, i.e. neo-classical environmental economics and ecological economics, are compared. Some key differences such as weak versus strong sustainability, commensurability versus incommensurability and ethical neutrality versus different values acceptance are pointed out. Munnichs, Geert, "Whom to Trust? Public Concerns, Late Modern Risks, and Expert Trustworthiness," Journal of Agricultural and Environmental Ethics 17(2004):113-130. This article discusses the conditions under which the use of expert knowledge may provide an adequate response to public concerns about high-tech, late modern risks. Scientific risk estimation has more than once led to expert controversies. When these controversies occur, the public at large--as a media audience--faces a paradoxical situation:

on the one hand it must rely on the expertise of scientists as represented in the mass media, but on the other it is confused by competing expert claims in the absence of any clear-cut standard to judge these claims. The question then arises, what expertise can the public trust? I argue that expert controversies cannot be settled by appealing to neutral, impartial expertise, because each use of expert knowledge in applied contexts is inextricably bound up with normative and evaluative assumptions. This value-laden nature of expert contributions, however, does not necessarily force us to adopt a relativist conception of expert knowledge. Nor does it imply active involvement of ordinary citizens in scientific risk estimation—as some authors seem to suggest. The value-laden, or partisan, nature of expert statements rather requires an unbiased process of expert dispute in which experts and counter-experts can participate. Moreover, instead of being a reason for discrediting expert contributions, experts' commitment may enhance public trustworthiness because it enlarges the scope of perspectives taken into account, to include public concerns. Experts who share the same worries as (some of) the public could be expected to voice these worries at the level of expert dispute. Thus, a broadly shaped expert dispute, that is accessible to both proponents and opponents, is a prerequisite for public trust. Keywords: expert controversies, late modern risks, public trust. Munnichs is from Wageningen, The Netherlands. (JAEE)

Murphy, Andrew R. "Environmentalism, Antimodernism, and the Recurrent Rhetoric of Decline." Environmental Ethics 25(2003):79-98. I explore the main features and historical pedigree of antimodern environmental declinism, a prominent family of contemporary critiques that ascribes responsibility for environmental ills to the legacy of the Scientific revolution or "modernity" more generally. I argue that each of its three central oppositions (to the human/nature dichotomy, the dominance of scientific method,

and industrialism and technology) are part of a long-standing rhetorical tradition, and are neither unique nor unprecedented. I stress the communicative, narrative, persuasive, and political nature of the environmental project, rather than its claims to have arrived at an objective description of unprecedented ecological damage in late modernity. This view is perhaps less convincing to an audience looking for certainty in an age of science, but it is more faithful to the attenuated, mediated ways in which we experience and make sense of the world around us. Murphy-Lawless, Jo, "The Impact of BSE and FMD on Ethics and Democratic Process," Journal of Agricultural and Environmental Ethics 17(2004):385-403. The recent crises of BSE and FMD in the United Kingdom have revealed widespread concerns on the part of farmers and consumers about government regulations and handling of animal movements, animal welfare, and food safety. Both crises raised issues of government accountability and the lack of openness in public debate. The issues of democratic process and decision-making were especially strong in relation to the mass slaughter policy of the government to control FMD. This article explores public disquiet about these matters, as expressed through the reports of two public inquiries, and the perceived links between government decision-making and the needs of global agribusiness, to the detriment of family farms and animal welfare. In light of the growing evidence about the environmental and economic costs of agribusiness, the argument is made that strong programs of citizen action, such as the Devon Foot and Mouth Inquiry, that are grounded in an ethical stance on animal welfare can challenge the perspectives of central governments about concepts of cost, efficiency, and safety in agriculture. Keywords: citizen action, democratic process, epidemic animal illnesses, global agribusiness. The author is on the School of Nursing and Midwifery Studies, Trinity College, Dublin, Ireland. (JAEE)

Murphy, Patrick D., "Rethinking the Relations of Nature, Culture, and Agency." Environmental Values Vol.1 No.4(1992):311-320. ABSTRACT: Beginning with a critique of the Enlightenment human/nature dualism, this essay argues for a new conception of human agency based on culturopoeia and an application of an ecofeminist dialogic method for analyzing human-nature relationships, with the idea of volitional interdependence replacing ideas of free will and determinism. Further, it posits that we need to replace the alienational model of otherness based on a psychoanalytic model with a relational model of anotherness based on an ecological model, and concludes by encouraging attention to developing bioregional natured cultures in place of nation states and multinational corporations. KEYWORDS: Bioregionalism, culturopoeia, dialogics, ecology, human agency. English Department, Indiana University of Pennsylvania, 110 Leonard Hall, Indiana, Pennsylvania 15705-1094, USA.

Murphy, Patrick D., Literature, Nature, and Other Ecofeminist Critiques. Albany: State University of New York Press, 1994. 226 pages. \$ 18.95 paper. \$ 57.50 hardcover. A theoretical framework for environmental analysis, developing a conception of environmental literature with an emphasis on works by women. We need to reconceptualize woman/nature and nature/culture associations and to critique problems of the male poetic sex-typing of the planet. There is analysis of the works of Hampl, Harjo, Snyder, and Le Guin, Native Americans, Chicanas, and others. Is agency possible in a postmodern era? Murphy directs the graduate program in literature and criticism at Indiana University of Pennsylvania. (v5,#4)

Murphy examines Snyder's poetry and prose, including the Pulitzer Prize-winning Turtle Island. An introduction summarizes Snyder's career and provides an overview of the three factors Murphy finds crucial to understanding Snyder's works: Buddhism, ecology, and "field-composition" poetics of contemporary free verse. Previous critics have not recognized the extent to which these interpenetrate. With an extensive bibliography on Snyder. Murphy is in the English Department at Indiana University of Pennsylvania, and specializes in environmental writing and writers. (v3,#3)

Murphy, Patrick D. Literature, Nature, and Other: Ecofeminist Critiques. Reviewed in Environmental Ethics 21(1999):217-219.

Murphy, Patrick D. "Sex-Typing the Planet: Gaia Imagery and the Problem of Subverting Patriarchy." Environmental Ethics 10(1988):155-168. The ecology movement has recently attempted to reinvigorate the image of Earth in terms of Lovelock's and Epton's "Gaia hypothesis." I analyze the shortcomings of using Gaia imagery in the works of Lovelock, deep ecologists, feminists, and ecological poets, and conclude that while the hypothesis serves to alter consciousness, naming it Gaia reinforces the oppressive hierarchical patterns of patriarchal gender stereotypes that it opposes. We are moving toward a new paradigm of nonpatriarchal pluralistic co-evolution, but if deep ecology is going to promote fully its development, it needs to recast or cast aside Gaia imagery. Murphy is at the English department, University of Pennsylvania, Indiana, PA. (EE)

A discussion of the dangers of using the mythic idea of Gaia--the Earth Goddess--as a guiding metaphor of deep ecology and a new environmental consciousness. The idea of a feminine Gaia

reinforces oppressive hierarchical and patriarchal thinking and prevents the development of a new pluralistic non-gender paradigm of the human relation to nature. (Katz, Bibl # 2)

Murphy, Raymond, Rationality and Nature: A Sociological Inquiry. Boulder, CO: Westview Press, 1994. 295 pages. In contemporary society, the belief that reason, a distinctive characteristic of humans, enables them to reshape and master nature is contested by an alternative belief that nature is not so plastic, hence humans must adapt to nature and render development sustainable, or even limit growth. Social ecology claims that environmental problems result from institutional hierarchies and suggests decentralized institutions and egalitarian ethics. Deep ecologists stress the intrinsic value of nature and feminists postulate that women are inherently closer to nature than men. Murphy assesses these theories and goes on to propose a theory of environmental debt as a source of capital accumulation. He develops a model of "environmental classes" to understand the political and economic bases of conflict over the environment. Murphy teaches sociology at the University of Ottawa. (v7,#2)

Thormodsgard, C. van Riper III, and W. Wilde. "USGS Goals for the Coming Decade." Science Vol. 318, no. 5848 (12 October 2007): 200-01. The United States Geological Survey (USGS) sets as major research goals "understanding ecosystems and predicting ecosystem change." Perhaps somewhat surprisingly, the geological agency, far from simply mapping rocks, mineral deposits, aquifers, and rivers, says: "USGS will develop and convey a fundamental understanding of ecosystem distributions and their components and dynamics.... USGS is the primary governmental agency responsible for wildlife research and has, for example, been heavily involved in tracking bird deaths from West Nile virus." One wonders how this is shared with the U.S. Fish and Wildlife Service. Meanwhile, the USGS concern for sustainability and environmental health is welcome.

Myers, Nancy, "The Precautionary Principle Puts Values First," Bulletin of Science, Technology and Society 22(no. 3, June 2002):210-219. The precautionary principle is an emerging principle of international law but has only recently been proposed in North America as a new basis for environmental policy. On the surface it is a simple, common-sense proposition: in the face of possible harm, exercise precaution. But the enthusiasm the principle has stirred among public advocates suggests it has a deeper

appeal. It is, in fact, based on values related to "forecaring for life" and the natural world. The principle cannot effectively be invoked without stating these values up front. The principle makes it clear that decisions and developments in science and technology are based first of all on values and only secondarily on scientific and technological fact and process. Moreover, a precautionary approach is best carried out in the context of goals that embody the values of communities and societies. Myers is with the Science and Environmental Health Network. She a former managing editor and executive director of the Bulletin of the Atomic Scientists. (v. 15, # 3)

Myers, Norman, "The World's Forests: Need for a Policy Appraisal," Science 268 (May 12, 1995): 823-24. The World Commission on Forests and Sustainable Development is soon to be established and gives promise of a better appraisal of how forests can confer their manifold benefits on society. Forests once covered more than 40% of Earth's land surface, but their expanse has been reduced by one-third, mostly since 1950. Tropical forests have been reduced by half, the fastest vegetational change of this magnitude in human history. Forestry has so far been dominated by private interests, commercial for the most part. Certain of these interests could well have an expanded role in the future, but public interests deserve to be better represented in the policy arena, especially the fast-growing interests at a global level. Myers is an environmental consultant based in Oxford, UK. (v6,#2)

Myers, Norman, on the challenge side, and Vincent, Jeffrey R. and Panayotou, Theodore on the distraction side, "Consumption: Challenge to Sustainable Development ... or Distraction," Science 276 (4 April, 1997):53-57. Myers maintains that the problem triad of population, environment, and development is now being joined by consumption, and that first world standards of escalating consumption cannot be extended to the rest of the world, nor even maintained in the first world. Vincent and Panayotou reply that there are no inherent limits to consumption, so long as there is substitutability and recycling. Countries with high consumption also have better environmental quality, lower pollution levels, and so on. Eastern Europe, the most polluted environment in the world, was a low-consumption society. Third World nations, with dramatic environmental degradation can also be low-consumption societies. Myers replies that the Vincent and Panayotou scenario depends on markets, overlooks market externalities, and the gross inequities in who benefits from marketed consumption, and cannot be extrapolated to a global range. Myers is an environmental consultant, at Oxford University. Vincent and Panayotou are at the Harvard Institute for International Development. (v8,#2)

(Climate Institute, 324 Fourth St., NE, Washington, DC 20002. Phone 202/547-0104. Fax 202/547-0111. A startling study made by the Climate Institute, and funded by numerous authorities: The U.S. Department of State, the Environmental Protection Agency, the United Nations Environment Programme, the United Kingdom Overseas Development Administration, the Rockefeller Foundation, and others. About 25 million people have been uprooted for environmental causes, a number that exceeds the official total of 22 million refugees who have fled civil wars and persecution. Environmental refugees are those who are forced to leave traditional habitat that has been rendered temporarily or permanently unsuitable to support human life, usually through the depletion of water, soil, and forests. The primary exodus has been from portions of Africa's Sahel, India, China, Central America, and the Horn of Africa. Environmental breakdown rarely is the sole catalyst, but combines with poverty, repressive politics, and inequitable land tenure, in a struggle for the control of available resources. With a bibliography of over 1,000 references documenting the conclusions of the study. Myers is an environmental consultant and visiting fellow, Green College, Oxford University. Myerson, Allen, "U.S. Splurging on Energy After Falling Off its Diet," New York Times (10/22/98): A1. America's splurging energy use. In the 1970s and early 80s, the U.S. reduced its energy consumption even while population grew and the economy expanded. People installed thicker insulation and tighter windows, appliances and engines were made more efficient, business cut its energy use, and people wore sweaters instead of turning up their thermostats. After falling dramatically in the 1970s and early 80s, average American energy use is back up to nearly record levels (despite some gains in energy efficiency). Here are some of the reasons why. Energy prices today are lower than they were 25 years ago. Adjusting for inflation, gas is \$1 a gallon today compared to \$1.10 in 1973. A gallon of gasoline is now cheaper than a gallon of bottled water! U.S. gas prices are half what they are in Europe and Japan and U.S. consumers use twice as much energy per person as do the Europeans or the Japanese. Although houses are more energy efficient per square foot, they are getting bigger. Since 1970, average household size shrunk by one sixth and average new home sizes has grown by a one third (from 1600 to 2100 square feet). Standard ceiling height has gone from eight to nine feet. Like the trend in sports utility vehicles (SUVs), we can't seem to make houses big enough. Furthermore, homes are now stuffed with energy-hungry features. Air conditioners are now in 80% of homes (up from 40%), 57% of homes now have dishwashers (up from 17%), plus many homes now have Jacuzzis, security systems, computers, an on and on. Many of these gadgets suck electricity full time; they are never really off (though dormant, they are ready at the push of a button). Today in the U.S., energy consumption per person in the home is the same as in 1973. Electric utilities are now cutting the reimbursements they used to give for installing more efficient heating, cooling, and lighting.

On the roads, next year Americans will burn more fuel per person than in 1973, before the government set automobile fuel efficiency standards. Today people are driving more. Suburbs continue to sprawl--the average commute has grown one third in the last dozen years (to eleven and a half miles). Nearly one in five households has three or more cars (up from one in twenty-five in 1970). More people are driving light trucks (minivans, SUV and pickups) which now account for 50% of auto purchases and are exempt from fuel efficiency and some pollution standards. In the 1990s, average fuel efficiency of autos has not increased (after rising for a decade and a half). Cars are becoming more powerful: Average

auto horsepower is up from one hundred to one hundred-fifty in the last dozen years. Only 5% of Americans ride mass transit and that number is declining. Business use of energy has also jumped up 37% in last dozen years, despite the economy's shift from smokestack industries to software and entertainment (business use of energy had dropped 18% from 1973 to 1983).

With greater energy use comes greater dependence on foreign oil (now 50%, up from 35% in 1973) and increasing military expense of defending access to it. The more energy we use, the more difficult it will be to try to stem possible global warming. The U.S. is committed to reducing our greenhouse gas output by 7% (from 1990) levels by the year 2010; this is a 33% cut in projected growth of our greenhouse emissions. Our energy use also is responsible for oil pipe lines and drilling platforms in environmentally sensitive areas, and thus this use contributes to oil spills and related environmental degradation. Finally, almost all of the energy we use comes from fossil fuels, which are not a renewable source of energy and hence such a lifestyle is not a sustainable one. (v.9,#4)

Myhr, Anne Ingeborg, and Traavik, Terje, "Genetically modified (GM) crops: Precautionary science and conflicts of interests," Journal of Agricultural and Environmental Ethics 16(2003):227-247. Risk governance of GM plants and GM food products is presently subject to heated scientific and public controversies. Scientists and representatives of the biotechnology industry have dominated debates concerning safety issues. The public is suspicious with regard to the motives of scientists, companies, and political institutions involved. The dilemmas posed are nested, embracing value questions, scientific uncertainty, and contextual issues. The obvious lack of data and insufficient information concerning ecological effects call for application of the Precautionary Principle (PP). One of our major conclusions is that precautionary GMP usage requires risk assessment criteria yet undeveloped, as well as broader and more long-term conceptions of risk, uncertainty, and ignorance. KEY WORDS: conflicts of interests, genetically modified (GM) plants, GM food, the Precautionary Principle, public trust, scientific uncertainty, substantial equivalence. (JAEE)

Myhr, Anne Ingeborg and Traavik, Terje, "Sustainable development and Norwegian genetic engineering regulations: Applications, impacts, and challenges," Journal of Agricultural and Environmental Ethics 16(2003):317-335. The main purpose of The Norwegian Gene Technology Act (1993) is to enforce containment of genetically modified organisms (GMOs) and control of GMO releases. Furthermore, the Act intends to ensure that "production and use of GMOs should take place in an ethically and socially justifiable way, in accordance with the principle of sustainable development and without detrimental effects to health and the environment." We have investigated the extent to which the sustainability criteria were decisive for the destiny of one approved and one declined application of genetically modified plant release. KEY WORDS: consensus conferences, GMO regulation, the Norwegian Gene Technology Act, the notion of equal distribution, the Precautionary Principle, public perception, scientific uncertainty, sustainable development. (JAEE)

Myhr, Anne Ingeborg, and Traavik, Terje, "The Precautionary Principle: Scientific Uncertainty and Omitted Research in the Context of GMO Use and Release," Journal of Agricultural and Environmental Ethics 15(no. 1, 2002):73-86. Commercialization of genetically modified organisms (GMOs) have sparked profound controversies concerning adequate approaches to risk regulation. Scientific uncertainty and ambiguity, omitted research areas, and lack of basic knowledge crucial to risk assessments have become apparent. The objective of this article is to discuss the policy and practical implementation of the Precautionary Principle. A major conclusion is that the void in scientific understanding concerning risks

posed by secondary effects and the complexity of cause-effect relations warrant further research. Initiatives to approach the acceptance or rejection of a number of risk-associated hypotheses is badly needed. Further, since scientific advice plays a key role in GMO regulations, scientists have a responsibility to address and communicate uncertainty to policy makers and the public. Hence, the acceptance of uncertainty is not only a scientific issue, but is related to public policy and involves an ethical dimension. KEY WORDS: extended consent, GMO, Precautionary Principle, omitted research, scientific uncertainty, secondary effects. Myhr and Traavik are with the Department of Microbiology and Virology, University of Tromsø and Norwegian Institute of Gene Ecology, Tromsø, Norway. (JAEE)

Myskja, Bjorn K., "The Moral Difference between Intragenic and Transgenic Modification of Plants," Journal of Agricultural and Environmental Ethics 19(2006):225-238. Public policy on the development and use of genetically modified organisms (GMOs) has mainly been concerned with defining proper strategies of risk management. However, surveys and focus group interviews show that although lay people are concerned with risks, they also emphasize that genetic modification is ethically questionable in itself. Many people feel that this technology "tampers with nature" in an unacceptable manner. This is often identified as an objection to the crossing of species borders in producing transgenic organisms. Most scientists reject these opinions as based on insufficient knowledge about biotechnology, the concept of species, and nature in general. Some recent projects of genetic modification aim to accommodate the above mentioned concerns by altering the expression of endogenous genes rather than introducing genes from other species. There can be good scientific reasons for this approach, in addition to strategic reasons related to greater public acceptability. But are there also moral reasons for choosing intragenic rather than transgenic modification? I suggest three interrelated moral reasons for giving priority to intragenic modification. First, we should respect the opinions of lay people even when their view is contrary to scientific consensus; they express an alternative world-view, not scientific ignorance. Second, staying within species borders by strengthening endogenous traits reduces the risks and scientific uncertainty. Third, we should show respect for nature as a complex system of laws and interconnections that we cannot fully control. The main moral reason for intragenic modification, in our view, is the need to respect the "otherness" of nature.

Keywords: biotechnology - ethics - intragenic - natural species - transgenic.

Naess, Arne, Ecology, Community, and Lifestyle: Outline of an Ecosophy. New York: Cambridge University Press, 1989. Translated and revised by David Rothenberg from Ekologi, Samfunn og Livsstil. Oslo: Universitetsforlaget, 1974. (Norway)

Naess, Arne, "Living a Life that Reflects Evolutionary Insights," Conservation Biology 10(1996):1557-1559. A brief tribute to Michael Soulé. "The postulation of the inherent value of living beings and their diversity is contested by people who say that all value assertions are subjective. ... At our latest meeting it was refreshing to listen to Michael Soulé claim that conservation biology evidently is both a science and an assertion that biodiversity--a central concern of the science--is not an instrumental value but has value in itself. ... Why can't conservation biology announce the noninstrumental inherent value of biodiversity?" Naess originated the deep ecology movement and is professor emeritus, University of Oslo. (v7,#4)

Naess, Arne, "Beautiful Action: Its Function in the Ecological Crisis." Environmental Values Vol.2 No.1(1993):67-72. ABSTRACT: The distinction made by Kant between 'moral' and 'beautiful' actions is relevant to efforts to counteract the current ecological crisis. Actions proceeding from inclination may be

politically more effective than those depending on a sense of duty. Education could help by fostering love and respect for life. KEYWORDS: Beautiful actions, deep ecology, environmental education, Kant. Council for Environmental Studies, University of Oslo, PO Box 1116, Blindern 0317, Oslo 3, Norway.

Naess, Arne, "Should We Try To Relieve Clear Cases of Extreme Suffering in Nature?" Pan Ecology, vol. 6, no. 1, Winter 1991. Naess examines "the darker side of free nature." "Perseverance in the service of protecting nature, support of the deep ecology movement, does not imply any definite opinion on questions of unconditional goodness of nature as a set of ecosystems." "If adequate ecological knowledge were available, some of us would not hesitate to interfere on a large scale against intense and persistent pain." Naess would not interfere with most predation or parasitism, but thinks there are exceptions. He would, if he could, eliminate a reindeer parasite, Cephenomyia trompe, an insect whose larvae grow in the noses of reindeer and slowly suffocate them. "What do humans do when witnessing animals in what they think is unnecessary and prolonged pain? Those who intensively identify with the victims try to rescue them--provided it is not too late and a practical way is seen. Generalized, and made into a policy, rescue attempts would not amount to an attempt to interfere and reform nature." "Respect for the dignity of free nature and proper humility do not rule out planned interference on a greater scale, as long as the aim is a moderation of conditions of extreme and prolonged pain, human or nonhuman. Such pain eliminates the experience of a joyful reality. The higher levels of self-realization of a mature being require assistance to other living beings to realize their potentialities, and this inevitably actualizes concern for the sufferers." Naess is professor emeritus of philosophy at the University of Oslo and the founder of deep ecology. (v2,#1)

Naess, Arne, *The Selected Works of Arne Naess*. Volumes 1-10 Edited by Harold Glasser with assistance from Alan Drengson in cooperation with the author. The Netherlands, Spring, 2005. Publication made possible through a grant from the Foundation for Deep Ecology. The individual volumes are not available separately, the whole set must be purchased. The current price for all ten volumes from Springer is US \$1,900. ISBN: 1-4020-3727-9. Volumes:

Vol 1: Interpretation and Preciseness: A Contribution to the Theory of Communication.

Vol 2: Scepticism: Wonder and Joy of a Wandering Seeker.

Vol 3: Which World Is the Real One? Inquiry into Comprehensive Systems, Cultures, and Philosophies.

Vol 4: The Pluralist and Possibilist: Aspects of the Scientific Enterprise, Rich Descriptions, Abundant Choices, and Open Futures.

Vol 5: Gandhi and Group Conflict: Exploration of Nonviolent Resistance, Satyagraha.

Vol 6: Freedom, Emotion and Self-Subsistence: The Structure of a Central Part of Spinoza's Ethics.

Vol 7: Communication and Argument: Elements of Applied Semantics.

Vol 8: Common Sense, Knowledge, and Truth: Open Inquiry in a Pluralistic World, Selected Papers.

Vol 9: Reason, Democracy, and Science: Understanding Among Conflicting Worldviews, Selected Papers.

Vol 10: Deep Ecology of Wisdom: Explorations in Unities of Nature and Cultures, Selected Papers.

A critical appreciation of Naess and this ten volume set by David Orton is online at: http://home.ca.inter.net/~greenweb/Naess_Appreciation.html.

Naess, Arne, "The Third World, Wilderness, and Deep Ecology," in George Sessions, ed., Deep Ecology for the 21st Century (Boston: Shambhala Publications, 1994). Answers Ramachandra Guha's critique of wilderness as a first world luxury. (v7,#2)

Naess, Arne, "A Defence of the Deep Ecology Movement," Environmental Ethics 6(1984):265-270. An answer to the charges made by Watson (see 1983). Naess rests his case on the non-academical character of Deep Ecology philosophy--it is not a precise university exercise, and Watson is wrong to treat it as such. But that is just the problem with Deep Ecology: if it is to be accepted by the intellectual community, it needs to be more precise. (Katz, Bibl # 1)

Naess, Arne, Ecology, Community and Lifestyle: Outline of an Ecosophy. Translated and edited by David Rothenberg. Cambridge: Cambridge University Press, 1989. Pp. xiii, 223. This is an updated and revised version of Naess' 1976 Norwegian work of the same title; many sections have been re-written by Naess and Rothenberg, and it includes a new introduction by Rothenberg. This is the most complete expression of the philosophy of "deep ecology" by the leading thinker in the field; its availability in English is the most important development in recent years. Unlike the fragmentary articles by Naess that have been published previously, this book develops the full argument for Ecosophy T, the world-view that supports the practical platform of deep ecology. It is made clear that deep ecology is much less a system of ethics than a theory of ontology and epistemology: it is the use of ecological thinking in the construction and apprehension of the world. The central ecological insight is a relational ontology, combined with an epistemology of gestalt experience. Gestalt thinking permits the integration of fact, emotion, and value into our basic understanding of the world, and it sets the foundation for a wider identification with all of reality.

This, in turn, leads to the derivation of the key norm and ultimate goal of the system, Self-realization, where Self is conceived as "an unfolding of reality as a totality" (p. 84), with a goal of perfection. In three "less philosophical" chapters, Naess shows how this world-view can lead to practical programs in the fields of technology, economics, and politics. He concludes the book with a systematic sketch of the norms and basic principles of his personal variant of deep ecology, Ecosophy T: intrinsic value; unity, diversity, and complexity; identification with nature; and self-realization. This text greatly increases the philosophical rigor of the system of deep ecology, but the chief problem remains the starting point of immediate experience and intuition. Naess and Rothenberg each see this is an advantage, for it permits the development of personal ecosophies leading to the common practical platform of deep ecological action. Intuition is also the fundamental source of value in the total-view descriptions of the world. But it is unclear how the starting points of personal experiences/intuitions can avoid a relativity of value and world-view. Thus, fundamental differences in the practical platform should develop. (Katz, Bibl # 2)

Naess, Arne, "Comment: 'Man Apart' and Deep Ecology: A Reply to Reed," Environmental Ethics 12(1990):185-192. Naess comments on Peter Reed, "Man Apart: An Alternative to the Self-Realization Approach," Environmental Ethics 11 (1989):53-69. There is a lucid explanation of "identification" as the opposite of "alienation"---identification does not mean "resemblance."

Naess, Arne, "The Deep Ecological Movement: Some Philosophical Aspects" Philosophical Inquiry 8, nos. 1-2 (Winter-Spring 1986):10-31. A good summary of the major philosophical assumptions, arguments, and intuitions of Deep Ecology. (Katz, Bibl # 1)

Naess, Arne. "A Defence of the Deep Ecology Movement." Environmental Ethics 6(1984):265-70. There is an international deep ecology social movement with key terms, slogans, and rhetorical use of

language comparable to what we find in other activist "alternative" movements today. Some supporters of the movement partake in academic philosophy and have developed or at least suggested philosophies, "ecosophies," inspired by the movement. R. A. Watson does not distinguish sufficiently between the movement and the philosophical expressions with academic pretensions. As a result, he falsely concludes that deep ecology implies setting man apart from nature--a kind of "anthropocentrism" in his terminology: humans and only humans have no right to interfere with natural processes. What the deep ecology movement insists on is rather that life on Earth has intrinsic value and that human behavior should and must change drastically--and soon. Naess is retired from the philosophy department, University of Oslo, Oslo, Norway. (EE)

Nagy, Kelsi, Values in Action: A Philosophic Analysis of Moral Motivation in Two Classics of Environmental Literature. M.A. Thesis, Colorado State University, Fall 2005. Neither Kant's ethics nor utilitarianism gives a convincing account of how people are motivated to act as moral agents. Environmental literature is often a more successful way to motivate people to accept the environment as an object of moral concern. This thesis analyzes Thoreau's Walden and Leopold's A Sand County Almanac, using Harry G. Frankfurt's theory that a free action requires that a person engage in reflection, choose which value she wants, then is effectively motivated by the freely chosen value. Thoreau and Leopold use literature to engage the reader into reflection on values, specifically those economic and scientific values that have an effect upon our actions toward the environment. Narrative discourse can

lead people to reflect on values that effectively motivates action in a way that, while different than philosophic argumentation, may be an equally important discourse for moral motivation. The advisor was Holmes Rolston.

Narveson, Jan. "The Case for Free Market Environmentalism." Journal of Agricultural and Environmental Ethics 8(1995):145-156. Environmental Ethics is the ethics of how we humans are to relate to each other about the environment we live in. The best way to adjust inevitable differences among us in this respect is by private property. Each person takes the best care of what he owns, and ownership entails the free market, which enables people to make mutually advantageous trades with those who might use it even better. Public regulation, by contrast, becomes management in the interests of the regulators, or of special interests, such as lovers of rare species -not the people they're supposed to be serving. (JAEE)

Nash, James A., "Biotic Rights and Human Ecological Responsibilities," The Annual, Society of Christian Ethics, 1993, pages 137-162. Boston: The Society of Christian Ethics, 1993; distributed by

Georgetown University Press. The concept of biotic rights is the most interesting issue, and one of the most important, on the frontier of ethics. It points to the fundamental task of redefining responsible human relationships with the rest of the planet's biota, and grounding these human responsibilities not only, weakly, in human utility or even generosity, but also, strongly, in the just dues and demands imposed on us by the vital interests of other kinds. Biotic rights highlight the centrality of ecological justice, rather than solely benevolence. Nash is Director of the Churches' Center for Theology and Public Policy, Washington. (v4,#4)

Nash, Roderick Frazier, The Rights of Nature: A History of Environmental Ethics. Madison: University of Wisconsin Press, 1989. Pp. xiii, 290. This is a work of intellectual history, not philosophy. It catalogues the growth of the idea that non-human nature deserves moral consideration, with a primary focus on American environmentalism and its antecedents in Great Britain. The book is a rich source of bibliographic and historical material, and it provides excellent summaries of the positions and arguments of philosophers, environmentalists, and other social reformers. The book has one major flaw: Nash commits himself to a model of "moral extensionism" based on the expansion of classical liberalism and "natural rights" theory. He attempts to explain all the moral positions concerning non-human nature as variations of the growth of individual human rights. But much of environmental ethics cannot be contained in such a restrictive, individualistic model, and Nash's text demonstrates this. He repeatedly cites positions that do not call for the rights of nature: "While Thoreau avoided the word 'rights'...(p. 37); "McGee was referring to the right of people to use nature, not the rights of nature..." (p. 50); Women "shy away from that staple of the liberal credo, individual rights" (p. 146). Because of this restrictive perspective, Nash mis-reads much of the current eco-philosophical literature (in Chapter 5, "The Greening of Philosophy," pp. 121-160). He conflates the ideas of individual rights, intrinsic worth, and communal holism, thus seemingly equating philosophers as diverse as Arne Naess, Paul Taylor, and Baird Callicott. Contains excellent notes and bibliographic essay. (Katz, Bibl # 2)

Nash, Roger, "Adam's Place in Nature: Respect or Domination?", Journal of Agricultural Ethics 3(1990):102-113. The creation story in Genesis speaks of humankind being given dominion over nature. Does this support the view that nature has solely instrumental value, and is of worth only insofar as it serves the necessities and conveniences of the human species? It is argued that these images, in their

qualification and enrichment of each other develop the idea that animals are of worth independently of their usefulness to us. Other key parts of the Bible, that at first may seem to promote unfettered domination, are shown to be more properly read as supporting an animal-benign religious ethics. Nash is in philosophy at Laurentian University, Ontario.

Nasr, Seyyed Hossein, "The Spiritual and Religious Background of the Environmental Crisis," The Ecologist 30 (No. 1, Jan 01 2000): 18- . The present environmental crisis is above all a conceptual and spiritual crisis. By adopting a worldview that separates humanity from Nature we have come to see what was previously a sacred Earth as a resource to be exploited for economic ends. (v.11,#2)

Nasr, Seyyed Hossein, Religion and the Order of Nature. New York: Oxford University Press, 1996. 320 pp. \$18.95 paper. The historical process through which Western civilization moved away from the idea of nature as sacred and embraced a world view that sees humans as alienated from nature and nature itself as a machine to be dominated and manipulated by humans. Nasr's goal is to negate the totalitarian claims of modern science and its reductionist view of nature and to re-open the way to the religious view of the order of nature, developed over centuries in the cosmologies and sacred sciences of the great religious traditions. Each tradition has a wealth of knowledge and experience concerning the order of nature. They have in common the conviction that nature is sacred. The recovery of this knowledge would allow religions all over the globe to enrich each other and cooperate to heal the wounds inflicted upon the Earth in the current environmental crisis. Nasr is in Islamic studies at George Washington University. (v7,#4)

Nasr, Seyyed Hossein. Religion and the Order of Nature. New York: Oxford University Press, 1996. 320pp. \$18.95 paper, \$65 cloth. Nasr argues that the devastation of our world has been exacerbated, if not actually caused, by the reductionist view of nature that has been advanced by modern secular science. He advocates the recovery of the truth that nature is sacred. (v8,#1)

NaughtonTreves (Naughton-Treves), Lisa, and Sanderson, Steven, "Property, Politics and Wildlife Conservation," World Development 23 (no. 8, 1995):1265-1275. Wildlife conservation and property rights. A summary of the historical development of wildlife property rights. The political determination of property regimes is critical to conservation, especially in regard to wild fauna. Property rights concerning wild fauna differ from other property rights claims, including landed property, intellectual property, and rights governing the use of wild flora. No single property form is adequate for wildlife conservation. Property as an institution is incomplete; the exceptional character of wild fauna and the property rights that govern it are organic. The authors are at the University of Florida, Gainesville. (v.10,#2)

Naylor, Raymond L., Williams, Susan L., and Strong, Donald R., "Aquaculture--A Gateway for Exotic Species," Science 294(23 November 2001):1655-1656. The farming of fish, shellfish, and aquatic plants is among the fastest growing segments of the food economy, taking place internationally and in all fifty U.S. states. Accidental escapes and purposeful releases create biological poison with irreversible and unpredictable biological impacts--seaweed in Hawaii, Asian carp established in rivers in the Mississippi basin, introduced salmon, alien mollusks, all these with parasites and alien species hitchhiking with them--are creating ecological havoc. Regulation is a quagmire, and a clear and enforced policy on exotic introduction is needed as aquaculture expands. Naylor is at the Center for Environmental Science and Policy, Stanford University; Williams and Strong at Bodega Marine Laboratory, University of California, Davis. (v.13,#1)

Needham, E.A. & Lehman, Hugh, "Farming Salmon Ethically", Journal of Agricultural and Environmental Ethics 4(1991):78-81. Salmon farming is a rapidly expanding industry. In order for it to develop in an ethical manner, many ethical issues must be confronted. Among these are questions regarding the quality of life of salmon on farms. To develop reasonable answers to these questions considerable thought must be devoted to developing appropriate standards of care for salmon. If these questions are not addressed the results could be bad both for salmon and for salmon farmers.

Nees, Dan, Valerie E. Green, Kim Treadway, John Lafferty, Michelle Vanyo, Paul Date, and Robert Hunt Sprinkle. "Activism, Objectivism, and Environmental Politics." Environmental Ethics 25(2003):295-312. Environmental activism, like all great activisms, is fundamentally normative, its principal beliefs contestable, its most powerful arguments rebuttable on the grounds that they are subjective. Environmental activists, as political tacticians with complex goals, have become skilled at presenting objectified versions of their own motivations when trying to broaden support for specific policies or take advantage of regulatory or legal opportunities. While instrumentally tempting and often expedient, this practice of objectifying moral arguments is in some respects disingenuous, and its successes as well as its failures bring with them characteristic risks, short-term and long-term. (EE)

Negri, Valeria, "Agro-Biodiversity Conservation in Europe: Ethical Issues," Journal of Agricultural and Environmental Ethics 18(2005):3-25.

Diversity in agro-ecosystems is under threat. This paper is focused on the biodiverse agro-ecosystems generated by landraces (LRs), i.e., farmer-developed populations of cultivated species that show among- and within-population diversity and are linked to traditional cultures. The aim of this work is to arouse concern about their loss, to explain how they can be conserved, and to discuss values that support maintaining and/or restoring on-farm agro-biodiversity. This is discussed with particular reference to the European situation. Keywords biodiversity - complexity - ethics - landraces - on-farm conservation - sustainability. Negri is in biology and agro-environmental biotechnology, Università del G. Studi, Perugia, Italy. (JAEE)

Neill, Warren, "An Interest-Satisfaction Theory of Value," Ethics and the Environment 3(1998):55-80. In this paper I argue that all value is rooted in the interests of valuing beings. If something satisfies an interest of a valuing entity by contributing to its well-being in some way, then it has value. Anything that

fails to satisfy any interests is entirely lacking in value. I defend this conception of value by showing that the usual arguments directed against this kind of view are lacking in force, and by considering various other theories of value and showing that they suffer from serious problems. Finally, I clarify some important distinctions between intrinsic, extrinsic, inherent, and instrumental value. Warren is in philosophy, State University of West Georgia, Carrollton, GA. (E&E)

Neill, Warren. "An Emotocentric Theory of Interests." Environmental Ethics 20(1998):163-82. Environmental Ethics 20(1998):163-82. It is plausible to hold that ethical obligations are concerned with bringing about the existence of things that have value, where something is of value if and only if it is in the interest of some entity. Here the notion of an interest may be defined as whatever contributes to the well-being of a morally significant entity. I argue that interests are limited to individuals with the capacity for affective response. After briefly distinguishing between various different types of value, I defend this emotocentric theory of interests against objections raised by Paul Taylor and Gary Varner, both of whom grant interests to a larger class of entities. I argue that there are serious problems with attempts to associate interests with mere goal-directedness or with the mere possession of biological functions. Neill is in philosophy, State University of West Georgia, Carrollton, GA. (EE)

Neilson, R. P., et al., "Forecasting Regional to Global Plant Migration in Response to Climate Change," Bioscience 55(no.9, September 2005): 749-760. The rate of future climate change is likely to exceed the migration rates of most plant species. The replacement of dominant species by locally rare species may require decades, and extinctions may occur when plant species cannot migrate fast enough to escape the consequences of climate change. Such lags may impair ecosystem services, such as carbon sequestration and clean water production. Thus, to assess global change, simulation of plant migration and local vegetation change by dynamic global vegetation models is critical, yet fraught with challenges.

Nelson, James Lindemann, "Moral Sensibilities and Moral Standing: Caplan on Xenograft 'Donors'", Bioethics, 7 (1993): 315-22. Interspecies transplantation - or xenograft - must answer the challenge that many nonhumans are on a moral par with mentally handicapped humans, and hence are equally immune from being unwilling sources of vital organs (the so-called "marginal cases" argument). Arthur Caplan has offered perhaps the most interesting counter to this argument, which appeals in part to differences in patterns of sensibility - in brief, humans would tend to suffer more if their children, handicapped or not, were used as organ sources than would nonhuman parents. It is argued that his defence cannot fully meet the weight of the strongest moral challenges to xenograft, in part because it does not address the distinction between what we "do" care about, and what we "should" care about.

Nelson, James Lindemann. "Health and Disease as 'Thick' Concepts in Ecosystemic Contexts." Environmental Values 4(1995):311-322. I consider what kind of normative work might be done by speaking of ecosystems utilising 'medical' vocabulary - drawing, that is, on such notions as 'health', 'disease', and 'illness'. Some writers attracted to this mode of expression have been rather modest about what they think it might purchase. I wish to be bolder. Drawing on the idea of 'thick' evaluative concepts as discussed by McDowell, Williams and Taylor, and resorting to a phenomenological argument for a kind of moral realism, I argue that the project of developing a robust understanding of the moral significance of recognising the health or illness of ecosystems is definitely a starter. KEYWORDS: Ecosystem health, intrinsic value, 'thick' evaluative concepts. Nelson is in the department of philosophy, University of Tennessee. (EV)

--Nelson, Lance, "The Dualism of Nondualism: Advaita Vedanta and the Irrelevance of Nature" (pp. 61-88). "First, I will show the falsity of the suggestion that Advaita Vedanta finds spiritual value inherent in nature. I will then proceed to explain precisely how Shankara and his tradition devalue the natural world and how ... the world is not revered but rather tolerated until it passes completely away. My conclusion will be that this is not the kind of nondualism that those searching for ecologically supportive modes of thought might wish it to be" (p. 68). Nelson is in religious studies at the University of San Diego.

Nelson, Michael P., "Holists and Fascists and Paper Tigers...Oh My!," Ethics and the Environment 1(no.2, 1996):103-117. Over and over, philosophers have claimed that environmental holism in general, and Leopold's Land Ethic in particular, ought to be rejected on the basis that it has fascist implications. I argue that the Land Ethic is not tantamount to environmental fascism because Leopold's moral theory accounts for the moral standing of the individual as well as "the land," a holistic ethic better protects and defend the individual in the long-run, and the term "fascism" is misapplied in this case. Nelson teaches philosophy at the University of Wisconsin, Stevens Point. (E&E)

Nelson, Michael P. "A Defense of Environmental Ethics: A Reply to Janna Thompson." Environmental Ethics 15(1993):245-57. Janna Thompson dismisses environmental ethics primarily because it does not meet her criteria for ethics: consistency, non-vacuity, and decidability. In place of a more expansive environmental ethic, she proposes to limit moral considerability to beings with a "point of view." I contend, first, that a point-of-view centered ethic is unacceptable not only because it fails to meet the tests of her own and other criteria, but also because it is precisely the type of ethic that has contributed to our current environmental dilemmas. Second, I argue that the holistic, ecocentric land ethic of Aldo Leopold, as developed by J. Baird Callicott, an environmental ethic that Thompson never considers, nicely meets Thompson's criteria for acceptable ethics, and may indeed be the cure for our environmental woes.

Nelson, R. J. "Ethics and Environmental Decision Making." Environmental Ethics 1(1979):263-78. Environmental ethics tends to be dominated by the idea that the right environmental actions require a change in the value systems of many people. I argue that the "rebirth" approach is perverse in that moral attitudes are not easily changed by moral suasion. A properly ethical approach must begin where we are, as moderately moral people desiring the best for all. The real ethical problem is to develop procedures for collectively defining environmental ends that will be fair to the parties participating in the decision process. This idea is essentially utilitarian, and depends on the maximization of expected social utility. This type of environmental ethics is contrasted with current theories of social choice in welfare economics and with Rawls' theory of justice as fairness. Nelson is in the philosophy department, Case Western Reserve University, Cleveland, OH. (EE)

Nelson, Robert H., "Unoriginal Sin: The Judeo-Christian Roots of Ecotheology," Policy Review, Summer 1990, no. 53. Environmental issues are becoming more important in the churches, but the new trends in environmental theology veer toward secularism, paganism, and Asian religions in a "pantheistic veneration of nature" "in which humanity must be understood as part of and not distinct from nature." But nature is red in tooth and claw, and at the same time, in "virtual self-contradiction" to the urged immersion of humans in nature, "the actual goal of environmentalism is the opposite: to inculcate a new morality with respect to the natural world that is found nowhere else in nature."

"The real source of the appeal of environmentalism may be that it offers traditional religious messages of the West in a new secular form--a form that, in an age of rampant secularism, lends these traditional messages great authority." Deep ecology is a kind of secular faith, with a version of the fall of humans from primitive innocence into technological greed and sin, alienated from an Eden Earth. For environmentalists, "save" means both "preserve" and "curb the influence of evil." "Reunion with nature for many in the current age has assumed the traditional meaning of reunion with God." The religious ascetic tradition also returns in environmental "preaching that material possessions and the good life are unnatural and to this extent evil." "Current environmental theology suggests that the poor should be content with their condition and are perhaps even better off for it." In fact, the Biblical stewardship theme, in which humans are distinct from and with dominion over nature, commissioned to tend and build a worldly residence, though disliked by deep environmentalists and ecotheologists, is the only adequate theological model for the protection and conservation of nature. Policy Review is published by the conservative think-tank, The Heritage Foundation, Washington. (v1,#4)

Nepstad, Daniel C., et al. (11 other authors), "Large-scale Impoverishment of Amazonian Forests by Logging and Fire," Nature 398(8 April 1999):505-508. Field surveys that map wood mills and forest burning areas in the Brazilian Amazon show that logging crews severely damage 10,000 to 15,000 square kilometers per year of forest that are normally not documented. In dry years this leaves up to 270,000 square kilometers vulnerable to future burning, and potentially doubles net carbon emissions during severe El Nino episodes. Nepstad is at the Woods Hole Research Center, Woods Hole, MA. (v.10,#1)

Nerlich, Brigitte, and Nick Wright, "Biosecurity and Insecurity: The Interaction between Policy and Ritual During the Foot and Mouth Crisis," Environmental Values 15(2006): 441-462. In 2001 a highly infectious animal disease, foot and mouth disease, broke out in the UK and spread rapidly. In May, when the spread seemed to be slowing down, new disease hotspots appeared in previously little affected regions, such as North Yorkshire. New biosecurity rules were imposed. Based on a series of semi-structured interviews with stakeholders, this article shows that the biosecurity measures farmers implemented during the epidemic meant more than just reducing the risk of spreading FMD. For many, cleansing and disinfecting became Foot and Mouth. Biosecurity actions became invested with symbolic values and, in particular, were ritualised as part of the symbolic spatial construction of an otherwise 'invisible' enemy. (EV)

Nesse, Randolph M., and George C. Williams, Why We Get Sick? : The New Science of Darwinian Medicine. New York: Times Books, Random House, 1994. Also New York: Vintage Books, 1996. Published in the U.K. as Evolution and Healing: The New Science of Darwinian Medicine. London: Weidenfeld and Nicolson, 1995. Human food habits and other behavioral propensities were shaped in the Pleistocene Period and this gets us in trouble in today's environment. For example, a predisposition to consume fat and sugar when available contributed to survival then, but to obesity, diabetes, and heart disease today. Various diseases result from a mismatch between our original environment and that in which we live today. In general, we have an evolved tendency to consume nature as we have opportunity, which spells ecological disaster today. Nesse is a physician in psychiatry at the University of Michigan Medical School. Williams is a well-known evolutionary biologist.

Nestle, Marion, Food Politics: How the Food Industry Influences Nutrition and Health. Berkeley: University of California Press, 2002. How the food industry turns wholesome natural ingredients into sweet, fatty and salty products. The American food supply is so abundant that we can feed everyone in this country twice over, even after subtracting food exports. The result forces food companies into fierce competition for consumer dollars. The foods most profitable to the industry are those that cater to our desires. The irony and tragedy is that this pattern, repeated in other developing countries, has resulted in the number of overweight people in the world, 1.1 billion, now equalling the number of undernourished people. Nestle is chair of nutrition studies at New York University and was an editor of the Surgeon General's Report on Nutrition and Health, 1988. (v.13, #3)

Nevers, Patricia, Gebhard, Ulrich, and Billmann-Mahecha, Elfreide, "Patterns of Reasoning Exhibited by Children and Adolescents in Response to Moral Dilemmas Involving Plants, Animals and Ecosystems," Journal of Moral Education 26(no. 2, 1997):169-186. The values and attitudes that children and adolescents have toward nature has been insufficiently researched, despite the fact that there is a growing body of philosophical theory in environmental ethics that might provide a framework for such analysis. The authors outline basic positions in environmental ethics (largely from the English literature) and formulate survey questions addressed to German children and adolescents. One finding is widespread anthropomorphism (not anthropocentrism) in children up to 10-11 years of age, regarding plants as well as animals. Children's fascination with animals is striking. Children have difficulty weighing personal interests against those of certain animals, such as dogs and rabbits. Children and adolescents can defend the interests of other animals and plants (biocentric reasoning), but there is no unequivocal evidence that they can be ecocentric. Nevers and Gebhard are at the University of Hamburg, and Billmann-Mahecha at the University of Hanover, Germany. (v.13,#2)

New Ground: A Journal of Development and the Environment has just been launched in South Africa as a journal with a black perspective on environmental conservation. The first issue was September 1990. Address: P. O. Box 62054, Marshalltown 2017, South Africa. (v1,#4)

New Ground: A Journal of Development and the Environment is a journal with a black perspective on environmental conservation and sustainable development. Published by an independent trust, the Environmental and Development Agency Trust. Address: P. O. Box 322, Newtown 2113, South Africa. ISSN 1016-8075. Editor: Dick Cloete. (v6,#3)

New Nietzsche Studies Vol. 5, no. 1/2 (2002). The topic of this special issue is “Nietzsche’s ecology.” Contents include: (1) “‘Did He Not Kiss the Horse?’ Nietzsche as Ecological Philosopher” by Wilhelm Schmid, (2) “Nietzsche and the Paradox of Environmental Ethics” by Martin Drenthen, (3) “A Banal Utopia or Tragic Recompense? Positivism, Ecology, and the ‘Problem of Science’ for Nietzsche” by Barry Allen, (4) “Nietzsche and Unamuno: The Meaning of the Earth” by Simón Royo Hernández, (5) “The Biopolitics of Art” by Steven T. Brown, and (6) “Nietzsche on the Disciplinary Practices of Western Culture” by David Michael Levin.

New Road, The is the bulletin of the World Wildlife Fund's Network on Conservation and Religion. Six issues each year. Internationally oriented. Short articles and news, names of contact persons, in attractive newspaper format. Contact: The New Road, 10 rue des Fosses, CH-110 Morges, Switzerland. (v1,#2) Now discontinued.

New York Times, "Cover-Up on Clean Air," October 6, 2004, editorial. The Bush administration has pushed the Environmental Protection Agency to reduce protection from industrial plants, here involving requirements to upgrade emissions protection when plants are upgraded. Congress asked for a review and an EPA inspector general, Nikki Tinsley, has issued a report quite critical of the administration. (v.14, #4)

New York Times, "Surrender in the Forests," July 18, 2004, p. 12. Lead Editorial. "The Bush Administration has taken apart so many environmental regulations that one more rollback should not surprise us. Even so, it boggles the mind that the White House should choose an election year to dismantle one of the most important and popular land preservations of the last 30 years--a Clinton administration rule that placed 58.5 million acres of the national forests off limits to new road building and development.

There are no compelling reasons to repudiate that rule and no obvious beneficiaries besides a few disgruntled Western governors and the timber, oil and gas interests that have long regarded the national forests as profit centers. It's not even a case of election-year pandering to Western voters; indeed, early returns suggest that most Westerners below the rank of governor do not like the Bush proposal at all." (v. 15, # 3)

New York Times, "Ocean Rescue," New York Times, August 6, 2004, p. A22. Editorial. Two landmark reports, one underwritten by the Pew Foundation and the other by Congress, identify three main threats to the oceans. (1) Deterioration of coastal wetlands and estuaries caused by agricultural runoff and relentless residential development. (2) Industrial overfishing. (3) Bureaucratic chaos. Several ocean rescue bills are in Congress. (v. 15, # 3)

New York Times, "Whales in the Way of Sonar," editorial, March 7, 2006.
<http://www.nytimes.com/2006/03/07/opinion/07tue2.html>

The debate over whether the Navy's use of sonar to detect submarines is harming whales continues in the waters off the southeastern United States, where the Navy hopes to establish a training area for sailors who need to practice their sonar skills in a shallow ocean environment. Evidence is mounting that sonar has been responsible for at least some of the whale strandings around the world.

New York Times, "Nature Besieged," August 2, 2004, A20. Editorial. A Bush Administration proposal to require each national forest to confine motorized off-road vehicles to designated trails, instead of allowing them to roam free, is commended. There are now 10 million such vehicles. (v. 15, # 3)

New York Times: "A New Way of Living With Nature." December 19, 1999. Editorial on "what can loosely be called the environmental ethic": "A century that will be remembered for material and scientific progress may also be remembered for something more modest--as a moment when mankind, realizing that the earth's resources were not finite and perhaps seeking expiation for years of predatory behavior, struck a truce with nature. For the first time since the dawn of the industrial age there was, at least in the West and certainly in America, a rough armistice between the forces of economic growth and the forces of preservation. ... Having discovered that we can actually change the way nature operates, we have also discovered that with this power comes a sacred obligation to restore what we once nearly ruined." (v10,#4)

New York Times, "Roadblock at Yucca Mountain," editorial, August 23, 2004, p. A22. How safe should nuclear waste storage be? A federal appeals court has overthrown the Environmental Protection Agency standard of 10,000 years (twice recorded human history) in favor of a standard of hundreds of thousands of years. In 1992 the U.S. Congress told EPA to set the standard based upon and consistent with the recommendations of the National Academy of Sciences, an unusual delegation of authority to a non-governmental agency. The NAS recommends hundreds of thousands of years for Yucca Mountain, a proposed underground storage site in Nevada. (v. 15, # 3)

New York Times, "Lost in the Haze," July 26, 2004, A 18. Editorial. Increasing pollution spillover destroys the visibility in national parks. (v. 15, # 3)

Newberry, Beatrice, "Running with gorillas," The Ecologist 30 (No. 4, 2000): 44-45. A unique conservation project in West Africa (Gabon) is turning the received wisdom about gorilla survival on its head, and may provide new hope for the survival of the great apes. (v.12,#3)

Nickel, James W., "Ethnocide and Indigenous Peoples," Journal of Social Philosophy, 25th Special Anniversary Issue, 1994, pp. 84-98. There is a qualified right against ethnocide (cultural genocide). A prohibition of ethnocide protects minorities and indigenous peoples against the inclination of mainstreamers to force them to abandon their distinctive ways of life and assimilate rapidly into the mainstream culture. Ethnocide is like genocide in being a means of getting rid of a group. Genocide involves the physical elimination of the group, whereas ethnocide could, in principle, leave all of the members of the group alive. Nickel is in philosophy at the University of Colorado. (v5,#4)

Nickel, James W. and Viola, Eduardo, "Integrating Environmentalism and Human Rights." Environmental Ethics 16(1994):265-273. The environmental and human rights movements have valuable contributions to make to each other. Environmentalists can contribute to the greening of human rights by getting the human rights movement to recognize a right to a safe environment, to see humans as part of nature, and to begin considering the idea that nature may have claims of its own. The human rights movement can contribute to environmentalism by getting environmentalists to recognize that they have strong reasons to support rights to political participation, freedom from violence, due process of law, education, and adequate nutrition. Nickel is with the Dept. of Philosophy, University of Colorado, Boulder. Viola is with the Dept. of Political Science and International Relations, University of Brasilia, Brazil. (EE)

Nickler, Patrick A., "A Tragedy of the Commons in Coastal Fisheries: Contending Prescriptions for Conservation, and the Case of the Atlantic Bluefin Tuna." Boston College Environmental Affairs Law

Review 26(No. 3, Spring 1999):549- . The Atlantic Ocean's population of bluefin tuna is under severe stress, and an international commission recommends no fishing for juvenile fish of this species for the indefinite future. But implementing this under the current management system is particularly ineffective. (v10,#4)

Niebuhr, Richard H., "Cosmic Patriotism," Religion and Values in Public Life: A Forum from Harvard Divinity School, vol. 2, no. 1, Fall 1992 (and mailed as a supplement to the Harvard Divinity Bulletin vol. 23, no. 1, 1993. "We seem to stand now at a fork in the path that we of the West have followed up to this point. One branch of the fork leads us toward continuing to treat the environment (and ourselves) as instrumental values. This is the path of prudence or prudential morality and religion. Evidently, it is the path on which both of our political parties wish to lead us. The other branch of the fork leads us into a future that we cannot forecast. All that we can dimly discern is that it leads to a way of conducting ourselves, a way of valuing our environment, our globe, not as instrumental to our desires but as beautiful and good: not a beauty and good belonging to us but a system of beauty and good to which we belong. Following this path would lead to a religious revolution, to a new attitude that William James called 'cosmic patriotism.'" With a long quotation from Aldo Leopold's "Thinking Like a Mountain." Niebuhr is professor of divinity at Harvard Divinity School. (v4,#4)

Nielsen, Annika Porsborg, Jesper Lassen and Peter Sandøe, "Democracy at its best? The consensus conference in a cross-national perspective," *Journal of Agricultural and Environmental Ethics* 20(2007):13-35. Over recent decades, public participation in technology assessment has spread internationally as an attempt to overcome or prevent societal conflicts over controversial technologies. One outcome of this new surge in public consultation initiatives has been the increased use of participatory consensus conferences in a number of countries. Existing evaluations of consensus conferences tend to focus on the modes of organization, as well as the outcomes, both procedural and substantial, of the conferences they examine. Such evaluations seem to rest on the assumption that this type of procedure has universally agreed goals and meanings, and that therefore consensus conferences can readily be interpreted and applied across national boundaries. This article challenges this approach to consensus conferences. The core of the article is a study of national differences in ideas about what constitutes legitimate goals for participatory arrangements. The study looks at three consensus conferences on GMOs, which took place in France, Norway, and Denmark. Drawing on this study, the article discusses the ways in which interpretations of the concept of participation; the value attributed to lay knowledge vs. technical expertise; as well as ideas about the role of the layperson, are all questions that prompt entirely different answers from country to country. Further, the article analyses these national differences within a theoretical framework of notions of democratic legitimacy. Keywords: Public participation - consensus conference - GMO - cross-national evaluation - participatory technology

assessment - TA - deliberative democracy - models of democracy - democratic legitimacy - lay and expert knowledge. The authors are at the Danish Centre for Bioethics and Risk Assessment, Royal Veterinary and Agricultural University, Copenhagen, Denmark.

Nieves, Evelyn, with Wald, Matthew L., "Park Service Plan Would Restore Wilderness to Yosemite," New York Times (3/28/00). Yosemite Plans to Take Out Human Structures. In an attempt to restore a wilder feeling to the Park, Yosemite National Park in California is proposing a major reduction in parking spaces, roads, bridges and buildings and planning to remove a dam obstructing the flow of the Merced River. The plan is a scaled back version of an earlier attempt to ban most private cars in Yosemite Valley, an attempt that led to major public opposition. With 4 million visitors last year, Yosemite suffers from overcrowding, traffic jams, and air pollution that almost violates U.S. Environmental Protection Agency standards. In the past, rangers have lowered the gates to the park to prevent more cars from entering. New parking lots outside the Park would be built from which visitors could take shuttle buses into the valley. U.S. Interior Secretary Bruce Babbitt claims the plan aims to "adapt visitors to the needs and forces of nature in the valley, rather than the other way around." The plan's goals are to reduce traffic congestion, reclaim natural beauty, allow natural processes to prevail, promote visitor understanding and enjoyment, and reduce overcrowding. Some conservation groups are critical of the plan, opposing the new parking spaces, additional restaurant space, and the diesel bus system. Says renowned conservationist David Brower, "This plan has smoke, mirrors and hesitation in it, and as we all know he who hesitates is lost, and is ready to make a down payment on the liquidation of the earth." (v.11,#1)

Nieves, Evelyn, "A Roundup of Wild Horses Stirs Up a Fight in the West," New York Times (2/25/02): A1. Wild horses in America: pest or symbol of the west? 46,000 wild horses and burros roam the American West. They are descendants of horses used by cowboys and Indians, pioneers and miners, ranchers and explorers. While some see these horses as a living legacy of the Wild West others view them as exotic pests who destroy the western range and steal grass from cattle and sheep. A decades old

debate rages between these two viewpoints. The Bureau of Land Management manages these horses and is trying to resolve the issue by capturing half the herd and putting them up for adoption. This is necessary, they say, so that the habitat can be preserved for all animals who graze on it, including cattle and sheep owned by private ranchers who pay for grazing rights on public lands.

Animal welfare advocates and the dozen or so wild horse protection organizations oppose this herd reduction program and have filed a lawsuit to prevent it. They object that the agency first factors in all the other users of the habitat before it comes up with its view of an "appropriate management level" for horses. They also view the adoption program as woefully inadequate, claiming that there are not enough takers for the horses, that public awareness of the program is insufficient, and that despite the BLM's regulations, adopted horses too often end up in slaughter houses. The Fund for Animals says its investigations show that most of the adopted horses end up in Canadian slaughterhouses for which there are no records. A 1997 investigation by the Associated Press found that BLM officials allowed the slaughter of hundreds of adopted wild horses and falsified records to thwart investigators.

Radical animal rights groups firebombed a BLM corral and tore down fences to protest the roundups. Wild horse opponents are fierce in their opposition as well. A spokesperson for the National Cattlemen's Beef Association says: "The problem with wild horses running around is they screw up improvements such as water tanks and water developments. They run down fences. With their broad feet, they destroy water springs and other things consistent with historical grazing use." One might also argue that because the horses were brought over by Europeans and have not co-evolved with the land for a sufficient period, they are exotics that do not belong on the range. (v.13,#2)

Nissani, M. "Brass-tacks Ecology." The Trumpeter 14, no. 3 (1997): 143-48. The author argues that environmentalists should focus their energies and resources on, and join other humanitarians in, an all-out campaign to eradicate private money from American politics. (v8,#3)

Nissani, Moti, "Brass-Tacks Ecology," The Trumpeter 14(no 3, 1997):1543-148. Environmental reform has failed, for two important reasons. First, the great majority of environmental thinkers ignore concrete political realities. Instead they are caught up in debates about the significance of one or another proximate cause of the environmental crisis (human domination of nature, overpopulation). The environmental movement is bereft of a core practical philosophy guiding its actions. Second, environmentalists misconstrue political realities, concentrating on this or that specific issue (the Endangered Species Act, water pollution), when the real problem is an economic and political system in which money counts as the bottom line. With some sobering illustrations from both business and politics. Nissani is in the Interdisciplinary studies Program, Wayne State University, Detroit. (v.8,#4)

Nissani, Moti "The Greenhouse Effect: An Interdisciplinary Perspective," Population and Environment: A Journal of Interdisciplinary Studies 17 (1996): 459-489. For a shorter, updated version, see "The Greenhouse Effect Revisited," in Theodore Goldfarb, ed., Taking Sides: Clashing Views on Controversial Environmental Issues. Guilford, CT: Dushkin, 1997, 7th edition. A typical current argument is that even if the greenhouse threat is real, even if temperatures rise and low-lying lands must be protected forever by an enormous system of dikes, such unlikely occurrences do not justify imposing vast costs on the present generation. We rather have, so the argument runs, a stronger obligation to help developing countries overcome the environmental problems that they are facing today. The author argues that anyone willing to cross disciplinary boundaries can easily ascertain that this surprisingly popular viewpoint is mistaken.

A case study in environmental history: the CFC ozone link is instructive. The nature of, evidence for, and the largely uncertain consequences of, the enhanced greenhouse effect on Earth are considered. For argument's sake, a conservative and arbitrary estimate is adopted, assuming that the chances of adverse greenhouse consequences within the next century are 10%; those of a cataclysm, 1%. Such chances should not be taken, because there is no conceivable reason for taking them. The steps that will eliminate the greenhouse threat will also save money and cut pollution, accrue many other beneficial consequences, and only entail negligible negative consequences. Humanity is risking its future for less than nothing. Claims that the greenhouse threat involves hard choices, that it is value-laden, or that it cannot be resolved by disinterested analysis, are tragically mistaken. Given the stakes of the greenhouse debate--the future of humanity--concerned scholars and citizens ought to understand this issue. (v7,#4)

Nockles, Joan M. "Katie John v. United States: Redefining Federal Public Lands in Alaska." Environmental Law 26, no.2 (1996): 693. Nockles analyzes the Ninth Circuit's majority and dissenting opinions in *Alaska v. Babbitt*, the official name for what is referred to in Alaska as the Katie John dispute. She argues that the majority opinion should have held that waters in which the United States holds a navigational servitude are "federal public lands" to which the Alaska National Interest Lands Conservation Act's rural subsistence priority must attach. Absent that finding, she concludes that an administrative solution will rectify the court's errors. (v7, #3)

Noe, Egon, Niels Halberg and Jens Reddersen, "Indicators of Biodiversity and Conservational Wildlife Quality on Danish Organic Farms for Use in Farm Management: A Multidisciplinary Approach to Indicator Development and Testing," Journal of Agricultural and Environmental Ethics 18(2005):383-414.

Organic farming is expected to contribute to conserving national biodiversity on farms, especially remnant, old, and undisturbed small biotopes, forests, and permanent grassland. This objective cannot rely on the legislation of organic farming solely, and to succeed, farmers need to understand the goals behind it. A set of indicators with the purpose of facilitating dialogues between expert and farmer on wildlife quality has been developed and tested on eight organic farms. Combined with a dialogue process, using these indicators could be an important key component of a farm wildlife management advisory tool. Key words biodiversity - conservational wildlife quality -farm management - indicators - organic farming - weed. The authors are in the Department of Agroecology, Danish Institute of Agricultural Sciences, Tjele, Denmark. (JAEE)

Nolt, John, A Land Imperiled: The Declining Health of the Southern Appalachian Bioregion. Knoxville: University of Tennessee Press, 2005. Detailed study of environmental loss and degradation in the Southern Appalachians; air, water, biota, population and urbanization, food, energy, consumption and waste, transportation, future prospects. At times Nolt writes with co-authors, specializing in particular areas, and always he writes with a philosopher's eye for ethical and value issues as he overlooks past and present in a region he loves. Nolt teaches philosophy at the University of Tennessee, Knoxville.

Nolt, John. "The Move from Good to Ought in Environmental Ethics." Environmental Ethics 28(2006):355-374. The move from good to ought, a premise form found in many justifications of environmental ethics, is itself in need of justification. Of the potential moves from good to ought surveyed, some have considerable promise and others less or none. Those without much promise include extrapolations of obligations based on human goods to nonsentient natural entities, appeals to educated judgment, precautionary arguments, humanistic consequentialist arguments, and justifications that assert that our obligations to natural entities are neither directly to those entities nor derived from our obligations to humans. Some arguments that extrapolate obligations based on goods involving sentience from humans to sentient animals are promising, but whether they are sufficient is controversial. Gandhian and Aristotlian arguments are also promising, provided we can justify their ought premises. (EE)

Nordstrom, Karl F., "Intrinsic Value and Landscape Evaluation," The Geographical Review 83 (no. 4, October 1993):473-476. The concept of intrinsic value in nature, as developed by philosophers, can provide geographers with a framework for examining both natural and human-altered landscape features in ways that do not appeal solely to human preference or utility. The concept can carry more weight in pragmatic decisions if it is defined and refined so that it retains its original meaning but is approximated by arguments in human terms. Three components of this meaning are: (1) essential or inherent, and not merely apparent, (2) originating or due to causes or factors within a body, (3) being good in itself or desired for its own sake, without regard to anything else. Accounts of intrinsic value, though they make objective reference, will also be of a subjective nature but this does not diminish the usefulness of the concept to geographers as a reference point in assessing changes in a landscape. Nordstrom is in geography and marine coastal science, Rutgers University. (v5,#4)

Nordstrom, Karl F., "The Concept of Intrinsic Value and Depositional Coastal Landforms," Geographical Review 80 (no. 1, 1990):68-81. Many recent studies in geography, ecology, and environmental ethics argue the need to manage natural resources in ways that do not appeal solely to human preference or utility. Nordstrom applies the concept of intrinsic value in nature to inanimate objects such as depositional landforms, comparing undeveloped coastal areas with those subjected to human modification. Such features as beaches and shoreline depositional forms can be dynamic landforms that are distinct from their surroundings and have symmetry and harmony, beginnings, endings, cycles with an integrity of place. Humans typically destroy these features with their alterations, but there can be enlightened management practices that respect such intrinsic values. An interesting blending of geography, marine science, and environmental ethics. Nordstrom is in geography and marine coastal science, Rutgers University. Philosophers who think that geographers don't do their philosophical homework should read the two preceding articles, or the next two. (v5,#4)

Preston, Christopher J. "Environment and Belief: The Importance of Place in the Construction of

Knowledge," Ethics and the Environment 4(1999):211-218.

In his popular first book, The Spell of the Sensuous, David Abram (1996) calls on us to recognize the encompassing earth "in all its power and its depth, as the very ground and horizon of all our knowing." By reemphasizing the connection between knowing and the earth, Abram hopes to encourage a more engaged existence with the flora, fauna, and landscapes among which we reside. Given that the earth is literally the ground and horizon of all our knowing, it makes sense--in fact, it is good for the senses--to consider for a while how the places in which we know come to exert their influence upon the constructions that we call knowledge. This paper is a sketch of a larger project to illustrate the epistemic significance of geography. Preston is in philosophy at the University of South Carolina, Columbia.

Norgaard, RB and Baer, P, "Collectively Seeing Climate Change: The Limits of Formal Models," BioScience 55 (no. 11, November 2005): 961-966. Understanding the risks posed by anthropogenic climate change and the possible societal responses to those risks has generated a prototypical example of the challenge of "collectively seeing complex systems." After briefly examining the ways in which problems like climate change reach the scientific and public agenda, we look at four different ways in which scientists collectively address the problem: general circulation models, integrated assessment models, formal assessments (e.g., the Intergovernmental Panel on Climate Change), and distributed learning networks. We examine strengths and limitations of each method, and suggest ways in which a greater awareness of the need for plural approaches could improve the basis for learning and decisionmaking.

Norgaard, Richard, B., Development Betrayed: The End of Progress and a Coevolutionary Revisioning of the Future. New York: Routledge, 1994. \$ 18.95 paper. \$ 59.95, cloth. 280 pp. A critique of modernity's vision of progress. Modernity's naive construction of integrated planning is wrapped-up in an unrealistic, monistic model of progress that dooms it to failure. The betrayal of progress is in our choice of an unsound process of development, not in the goals themselves. Like King Midas, in our pursuit of real and significant fruits, we failed adequately to consider the negative side effects: significant environmental degradation, increasing difficulty satisfying even basic human needs, and failing strategies for addressing cultural diversity. Chapter 6 is "The Philosophical Roots of Betrayal": atomism, mechanism, monism, objectivism, and universalism. In the second half of the book, Norgaard proposes a coevolutionary cosmology, replacing atomism with holism, mechanism with the systems concept, universalism with contextualism, objectivism with subjectivism, and monism with conceptual pluralism. Reviewed by Harold Glasser in Environmental Values 5(1996):267-270. Norgaard is president-elect of the International Society of Ecological Economics.

Norgaard, Richard B., "Environmentalism as the Salvation of Materialism," CTNS (Center for Theology and the Natural Sciences) Bulletin 16 (No. 3, Summer 1996):10-17. Environmental problems are typically framed as problems of spoiling or running out of the stuff needed for people's material sustenance in the future. Al Gore's Earth in the Balance offers a provocative illustration of how insidious materialism is, even for the best intentioned reflections on the environment. How will we move beyond materialism if we navigate from a map provided by a materialist science? By addressing the moral issues related to our material realities, the churches can heal important wounds. Additionally, the churches can help us recreate a sense of community, and thereby facilitate a collective revisioning of the future. Norgaard teaches in the Energy and Resources Program at the University of California, Berkeley, and is president of the International Society for Ecological Economics, of which he is a founder. Norlock is in philosophy St. Mary's College of Maryland. (E&E)

Norman Myers and Julian L. Simon, Scarcity or Abundance: A Debate on the Environment. New York: W. W. Norton, 1994. 254 pages. Julian Simon continues his famous offer to bet that "just about any trend pertaining to material human welfare will improve rather than get worse," and challenges betters to "pick the index." Myers replies that there are twice as many people on the planet as there were forty years ago, with many more now living in poverty and suffering, and 1.5 billion in absolute poverty. The betting is inappropriate, for the wealthy North, one-fifth of the world consuming four-fifths of its goods; human deprivation is quite evident for the four-fifths of the world that consumes one-fifth of its goods. Maybe environmentalists should bet this situation will worsen, and hope that they lose their bets. (v6,#4)

Normile, Dennis. "Driven to Extinction." *Science* Vol. 319, no. 5870 (21 March 2008): 1606-09. Rinderpest, an animal disease that devastated cattle and other animals and their human keepers across Eurasia and Africa for millennia, may join smallpox as the only viral diseases to have been eradicated. This would be, some say, the most remarkable achievement in veterinary medical history. In one epidemic, cattle shipped from India to feed an Italian army carried the virus to the horn of Africa in 1897. The virus soon reached Cape Town, killing about 90% of the cattle as well as large populations of sheep and goats. Domesticated oxen died, leaving farmers unable to plow fields. The virus also decimated populations of buffalo, giraffe, and wildebeest. A vaccine became available in the 1950s, but it has been difficult to achieve widespread vaccination and surveillance and to eliminate all the loci of infection.

Norris, Kathleen, Dakota: A Spiritual Geography. Ticknor and Fields, 224 pages. \$ 19.95. Norris is from Lemmon, South Dakota, 1,600 people, the largest town in an area twice the size of Massachusetts. Though reared first in New York, she has lived there twenty years, and knows both worlds. She finds the great plains a world where things are timeless and deep, offering gifts of grace and revelation, despite the usual perception that the Dakotas are stuck in an earlier, less relevant age. The plains are a sanctuary. Norris is a lay preacher in the Presbyterian Church, also an associate in a community of Benedictine monks, as well as an environmentalist and citizen. A very sensitive book, with a marvelous sense of place. (v4,#2)

Northcott, Michael S., "Ecology and Christian Ethics," in Robin Gill, ed., Cambridge Companion to Christian Ethics. Cambridge: Cambridge University Press, 2001. (EE v.12,#1)

Northcott, Michael S., The Environment and Christian Ethics. Cambridge: Cambridge University Press, 1996. 379 pp. \$59.95 (hb); \$21.95 (pb). Of the books on environmental ethics written from a perspective of Christian ethics, Northcott's survey best knows the philosophical literature, in addition to having a thorough familiarity with the theological literature. Northcott sums up his argument: "The resolution of the environmental crisis requires the rediscovery of the existence of value and moral significance in the objective world prior to human acts of valuing, an independence which Western theists have traditionally located in the original act of divine beneficence in the creation of the world. . . . Without a recovery of this traditional recognition of the moral order and purposiveness of the world, prior to its processing by human perception, I do not believe it will be possible for modern societies ultimately to reduce their impacts on the ecological integrity of the nonhuman world" (pp. 92-93). In this search, Northcott is especially interested in philosophical arguments for intrinsic value in nature, which are congenial with this divine creation of value.

Northcott recognizes amply that Christians have sometimes been the cause of environmental degradation; but he also believes that the primal Hebrew vision was "earth friendly" (p. 198), and that early Christianity with its understandings of the redemption of creation was also. The Christ is the Lord of nature, as well as of persons. Northcott argues for what he call a "restitution" of such worldviews (p. xiii, p. 239, p. 255). He has a soft spot for indigenous peoples, of whom he paints a rather rosy picture, and thinks that they were closer to the Hebrew mind than often realized. A central emphasis is on natural law, which Northcott hopes to recover. Northcott teaches Christian ethics at the University of Edinburgh. (v8,#3)

Norton argues on pragmatic "Deweyan" grounds that we should cease to ask scientists for value neutral definitions of "sustainability," developed independently of moral and social values, to guide our environmental policy making debates. "Sustainability," like human "health," is a normative concept from the start - one that cannot be meaningfully developed by scientists or economists without input by all the stake holders affected. While I endorse Norton's approach, I question his apparent presumption that concern for *sustainability* for the future is at odds with and ought to trump concern for *enhancement* in the present of public opportunities to access the goods nature represents. I argue that the two are not separable in practice. I argue for Passmore's position that unless we take care to enhance equitable access to the good and services nature represents in the present, we cannot succeed in promoting sustainability for future generations. Welchman is Department of Philosophy, University of Alberta, Edmonton, AB, Canada.

Norton, Bryan G. Sustainability: A Philosophy of Adaptive Ecosystem Management. Chicago: University of Chicago Press, 2005. Beginning with his experiences as a philosopher working at the Environmental Protection Agency, Norton argues that the central problem of environmentalism and environmental protection is a lack of effective communication. Following his interpretation of Aldo Leopold as an anthropocentric holist, environmental pragmatist, and adaptive manager, Norton critiques both

environmental economics and intrinsic value approaches to environmental ethics and, in their place, develops a theory of environmental values as community commitments and a normative vocabulary that will encourage interdisciplinary communication and social learning about environmental problems. Norton's adaptive ecosystem management is an American pragmatist-inspired account of experience, truth, and language motivated by the social values of democratic communities. He defines sustainability as "a relationship between generations such that the earlier generations fulfill their individual wants and needs so as not to destroy, or close off, important and valued options for future generations" (p. 363). Environmental philosophers should no longer articulate values but instead should only offer heuristics and linguistic choices to help improve communication among the stakeholders of democratic communities. The field of environmental ethics becomes a subfield of adaptive management science.

Norton, Bryan G. "Biodiversity and Environmental Values: In Search of a Universal Earth Ethic," Biodiversity and Conservation 9(no. 8, 2000):1029-1044. Abstract. While biodiversity protection has become a widely accepted goal of environmental protectionists, no such agreement exists regarding why it is important. Two, competing theories of natural value here called "Economism" and "Intrinsic Value Theory" - are often cited to support the goal. Environmentalists, who have recently proposed the articulation of a universal "Earth Charter" to express the shared values humans derive from nature, have cited both of these theories as support for biodiversity protection. Unfortunately, these theories, which are expressed as polar opposites, do not work well together and the question arises: is there a shared value that humans place on nature? It is argued that these two value theories share four questionable assumptions: (1) a sharp distinction between "intrinsic" and "instrumental" value; (2) an entity orientation; (3) moral monism; and (4) placeless evaluation. If these four assumptions are denied, an alternative value system emerges which recognizes a continuum of ways humans value nature, values processes rather than only entities, is pluralistic, and values biodiversity in place. An alternative theory of value, which emphasizes protecting processes rather than protecting objects, and which values nature for the creativity of its processes, is proposed as a more attractive theory for expressing the universal values of nature that should motivate an Earth Charter and the goal of biodiversity protection. Key words: biodiversity, creativity, social values, value theories.

Norton Bryan G., "Biodiversity and environmental values: In search of a universal earth ethic," Biology and Conservation 9(2000):1029-1044. Abstract. While biodiversity protection has become a widely accepted goal of environmental protectionists, no such agreement exists regarding why it is important. Two, competing theories of natural value - here called 'Economism' and 'Intrinsic Value Theory' - are often cited to support the goal. Environmentalists, who have recently proposed the articulation of a universal 'Earth Charter' to express the shared values humans derive from nature, have cited both of these theories as support for biodiversity protection. Unfortunately these theories, which, are expressed as polar opposites, do not work well together and the question arises: Is there a shared value that humans place on nature? It is argued that these two value theories share four questionable assumptions: (1) a sharp distinction between 'intrinsic' and 'instrumental' value; (2) an entity orientation; (3) moral monism; and (4) placeless evaluation. If these four assumptions are denied, an alternative value system emerges which recognizes a continuum of ways humans value nature, values processes rather than only entities, is pluralistic, and values biodiversity in place. An alternative theory of value, which emphasizes protecting processes rather than protecting objects, and which values nature for the creativity of its processes, is proposed as a more attractive theory for expressing the universal values of nature that should motivate an Earth Charter and the goal of biodiversity protection. Norton, Bryan G. "Environmental Ethics and Nonhuman Rights." Environmental Ethics 4(1982):17-36. If environmentalists are to combat effectively the continuing environmental decay resulting from more and more intense human exploitation of nature, they need a plausible and coherent rationale for

preserving sensitive areas and other species. This need is illustrated by reference to two examples of controversies concerning large public projects in wilderness areas. Analyses of costs and benefits to presently existing human beings and the utilitarian theory which supports such theories are inadequate to provide such a rationale, as other writers have shown. A number of environmentalists have suggested that ascriptions of rights to nonhuman animals, plants, and other natural objects may provide the necessary rationale. I argue that such ascriptions can only be effective if they are supported by a general theory of rights. Although no such general theory is developed, I state four minimal conditions which must be fulfilled by all rights holders as entailments of the concept of a right and, hence, as necessary conditions on rights holding, regardless of the general theory of rights espoused. I then argue that no appeals to rights of nonhumans can simultaneously fulfill these four minimal conditions and, on the other hand, satisfy the need for a coherent rationale for environmental preservation. In the central argument of the essay I exploit the distinction between the concern of vegetarians and antivivisectionists who rest their case for animal rights on the analogy of animal suffering to human suffering and the concern of environmentalists to protect the integrity of holistic ecosystems. I then conclude that even if the case for nonhuman rights can be made convincingly, the rights defended are insufficient for the development of a complete and coherent rationale for environmental preservation. Norton is at the Division of Humanities, New College of the University of South Florida, Sarasota, FL. (EE)

Norton, Bryan G. "Environmental Ethics and the Rights of Future Generations." Environmental Ethics 4(1982):319-37. Do appeals to rights and/or interests of the members of future generations provide an adequate basis for an environmental ethic? Assuming that rights and interests are, semantically, individualistic concepts, I present an argument following Derek Parfit which shows that a policy of depletion may harm no existing individuals, present or future. Although this argument has, initially, an air of paradox, I show that the argument has two intuitive analogues--the problem of generating a morally justified and environmentally sound population policy and the problem of temporal distance. These problems are shown both to resist solutions in individualistic terms and to embody difficulties similar to those raised by Parfit. Since utilitarianism and modern deontology are individualistic in nature, they cannot provide the basis for an adequate environmental ethic and they do not rule out policies such as that of depletion, which is clearly unacceptable environmentally. I close with an exploratory but generally pessimistic assessment of the possibility that rights and interests can be reconstrued as nonindividualistic. Norton is at the Division of Humanities, New College of the University of South Florida, Sarasota, FL. (EE)

Norton, Bryan G. and Robert E. Ulanowicz, "Scale and Biodiversity Policy: A Hierarchical Approach," Ambio 21 (no. 3, May 1992): 244-249. A hierarchical approach to natural systems, which assumes that small subsystems change according to a faster dynamic than do larger systems of which they are a part, is a useful means to conceptualize problems of scale in determining biodiversity policy. Conservation biology is a normative science that, like medicine, is shaped by a goal of protecting and healing ecosystems. The goal of sustaining biological diversity over multiple human generations implies that biodiversity policy must be set at the landscape level of the ecosystem. Since ecosystems can be described at many levels of organization, conservation biologists must model ecosystems on a scale appropriate to the crucial dynamic that supports the sustainability goal. This dynamic, the autopoietic feature of ecosystems, supports and sustains species across generations. The value of these ecosystem processes is measured as the avoided costs of sustaining species in zoos or highly managed habitats. The protection of the health of these landscape-level processes should therefore be the central goal of biodiversity policy. Norton is in the school of public policy, Georgia Institute of Technology. Ulanowicz is at the Chesapeake Biological Laboratory in estuarine science. (v5,#4)

Norton, Bryan G. and Bruce Hannon. "Environmental Values: A Place-Based Theory." Environmental Ethics 19(1997):227-245. Several recent authors have recommended that "sense of place" should become an important concept in our evaluation of environmental policies. In this paper, we explore aspects of this concept, arguing that it may provide the basis for a new, "place-based" approach to environmental values.

This approach is based on an empirical hypothesis that place orientation is a feature of all people's experience of their environment. We argue that place orientation requires, in addition to a home perspective, a sense of the space around the home place and that this dual aspect can be modeled using a "hierarchical" methodology. We propose a "triscalar," place-oriented system for the analysis of environmental values, explore the characteristics of place-orientation through several examples, and employ these characteristics to distinguish acceptable and unacceptable aspects of the NIMBY (not-in-my-backyard) idea. Norton is in the School of Public Policy, Georgia Institute of Technology, Atlanta. Hannon is in geography at the University of Illinois, Urbana. (EE)

Norton, Bryan G. "Environmental Ethics and Weak Anthropocentrism." Environmental Ethics 6(1984):131-48. The assumption that environmental ethics must be nonanthropocentric in order to be adequate is mistaken. There are two forms of anthropocentrism, weak and strong, and weak anthropocentrism is adequate to support an environmental ethic. Environmental ethics is, however, distinctive vis-a-vis standard British and American ethical systems because, in order to be adequate, it must be nonindividualistic. Environmental ethics involves decisions on two levels, one kind of which differs from usual decisions affecting individual fairness while the other does not. The latter, called allocational decisions, are not reducible to the former and govern the use of resources across extended time. Weak anthropocentrism provides a basis for criticizing individual, consumptive needs and can provide the basis for adjudicating between these levels, thereby providing an adequate basis for environmental ethics without the questionable ontological commitments made by nonanthropocentrists in attributing intrinsic value to nature. Norton is at the Division of Humanities, New College of the University of South Florida, Sarasota, FL. (EE)

Norton, Bryan G. "Why I am Not a Nonanthropocentrist: Callicott and the Failure of Monistic Inherentism." Environmental Ethics 17(1995):341-358. I contrast two roles for environmental philosophers--"applied philosophy" and "practical philosophy"--and show that the strategy of applied philosophy encourages an axiological and monistic approach to theory building. I argue that the mission of applied philosophy, and the monistic theory defended by J. Baird Callicott, in particular, tends to separate philosophers and their problems from real management issues because applied philosophers and moral monists insist that theoretical exploration occurs independent of, and prior to, applications in particular situations. This separation of theory and practice suggests that philosophers are likely to be effective in policy discussions only to the degree that they can offer unquestioned theories that adjudicate real problems. Callicott offers his monistic, ontological approach as universal guidance to environmental activists and decision makers, arguing that ecosystems and communities are moral subjects that can "own" their own inherent value. Callicott's theory, however, faces a crucial, unanswered theoretical dilemma which illustrates the impossibility of the dual task Callicott has set for his theory "to provide a single, ontological unification of ethics under nonanthropocentric holism and to capture the fine nuances of ethical obligations as experienced in varied communities." I also show that monistic assumptions have led to an unfortunate interpretation of Aldo Leopold's land ethic and that a pluralist and pragmatist direction is likely to provide a more efficacious and theoretically defensible direction for further study of environmental philosophy in a more practical mode. Norton is at the School of Public Policy, Georgia Institute of Technology. (EE)

Norton, Bryan G., Michael Hutchins, Elizabeth F. Stevens, and Terry Maple, eds., Ethics on the Ark: Zoos, Animal Welfare, and Wildlife Conservation. Washington, DC: Smithsonian Institution Press, 1995. 432 pages. \$ 32.50 cloth. Values underlying the conservation of nature in captivity. Zoos are not, or should not be, institutions for gawking at caged animals. They have been undergoing a metamorphosis from a menagerie symbolizing human mastery over the beasts to vital sites of ex situ species conservation. But does this self-redefinition morally justify their continued existence? The zoo question pits individualistic animal welfare ethics against holistic environmental ethics, a concern for specimens against a concern for species. Part I. The Future of Zoos. Part II. The Targets of Protection: Genes or

Individuals or Populations or Species or Ecosystems. Part III. Captive Breeding and Wild Populations.
Part IV. Good Stewardship. (v6,#4)

Norton, Bryan G., "Conservation and Preservation: A Conceptual Rehabilitation," Environmental Ethics 8(1986):195-220. A deep analysis of conservation and preservation as theoretical models of environmental policy. Norton is critical of the traditional way (following John Passmore) that conservation is viewed as anthropocentric while preservation is considered non-anthropocentric. The definitions of the policies need not include anthropocentric or nonanthropocentric motivations. Given a long time scale, these two motivations converge; what is good for a whole range of human values is also good for nature itself. (Katz, Bibl # 1)

Norton, Bryan G., Why Preserve Natural Variety? Princeton: Princeton University Press, 1987. Pp. xiii, 281. Norton focuses on the problem of justifying policies of species preservation as a paradigm for all environmental issues. The book has four basic parts. First, Norton shows the failure of economic "demand" values as a basis of preservationist policy. Second, he examines the problems in attributing intrinsic value to natural entities and systems. The third section, which is the heart of the book, is a presentation of Norton's theory of "weak anthropocentrism" or "transformative value." Nature preservation is justified because it leads to the fostering of specific values in human life and culture worth preserving. These higher order values are not reducible to any array of demand or preference values, but they are crucial in the development of an ecological world view. In the final section, Norton shows how a concern for transformative value can be translated into specific policy proposals. Norton's argument is a kind of "fall-back" position, a pragmatic recognition that arguments over the intrinsic non-anthropocentric value of nature only delay and obstruct policies of preservation. As such, it is the best expression of a compromise between an economically based resource environmentalism and the more radical biocentric versions of environmental ethics. But advocates of a deeper environmental ethic will be concerned that Norton's "transformative value" is just a higher order contingent instrumental value designed for the satisfaction of human interests. (Katz, Bibl # 2) Reviewed in Environmental Ethics 10(1988):275-78.

Norton, Bryan G., "On What We Should Save: The Role of Culture in Determining Conservation Targets," pages 23-29 in P. L. Forey, C. J. Humphries, and R. I. Vane-Wright, eds., Systematics and Conservation Evaluation, The Systematics Association, Special Volume No. 50 (Oxford: Clarendon Press, 1994). No one questions that we have a moral obligation to conserve biodiversity for future generations, but there is no consensus how to make this operational. There is no objective scientific definition of diversity, since all knowledge is theory-bound, and since natural systems are irreducibly complex. We need a post-modern, post-positivist account. "Diversity measures are constructs by human individuals who undertake their studies for many different motives." Given certain purposes, hierarchy theory is useful to minimize human alteration of natural systems, focussing on ecosystem health and structures and processes that perpetuate natural systems. Ecological economics is a bridging discipline to link ecology and culture. Norton is in the school of public policy, Georgia Institute of Technology. (v5,#4)

Norton, Bryan G., "Environmental Ethics and Weak Anthropocentrism," Environmental Ethics

6(1984):131-148. The third in a series by Norton, all appearing in this journal. Norton contrasts "strong" anthropocentrism--where all value is translated into felt human preferences--with "weak anthropocentrism"--where all value is derived either from felt human preferences or an ideal world view that is the source of preferences (see p. 134). Environmentalism is then justified on the basis of weak anthropocentrism: environmental protection is not based on the dubious ontological commitment to intrinsic value in natural entities, but rather on the continuation of a resource base for ongoing human consciousness. But Norton has to explain why the continuation of human consciousness is a good. He does not even attempt to justify this claim (p. 143). (Katz, Bibl # 1)

Norton, Bryan G. "Convergence and Contextualism: Some Clarifications and a Reply to Steverson." Environmental Ethics 19(1997):87-100. The convergence hypothesis asserts that, if one takes the full range of human values--present and future--into account, one will choose a set of policies that can also be accepted by an advocate of a consistent and reasonable nonanthropocentrism. Brian Steverson has attacked this hypothesis from a surprising direction. He attributes to deep ecologists the position that nonhuman nature has intrinsic value, interprets this position to mean that no species could ever be allowed to go extinct, and proceeds to show that my commitment to contextualism prohibits me from advocating the protection of species universally. In response, I show, by reference to recent scientific findings, how difficult it is to defend species preservation in all situations. In particular, I argue that Steverson's appeal to a possible world in which we have nearly complete biological knowledge misses the point of the convergence hypothesis. It is an empirical hypothesis, with significant indirect, and some direct, evidence to support it. Although it is a falsifiable hypothesis about real-world policies, it cannot be falsified by a contrary-to-fact case. Norton is in the Schol of Public Policy, Georgia Institute of Technology, Atlanta. (EE)

Norton, Bryan G. Review of Ecological Ethics and Politics. By H. J. McCloskey. Environmental Ethics 7(1985):71-74.

Norton, Bryan G. "Thoreau's Insect Analogies: Or, Why Environmentalists Hate Mainstream Economists." Environmental Ethics 13(1991):235-51. Thoreau believed that we can learn how to live by observing nature, a view that appeals to modern environmentalists. This doctrine is exemplified in Thoreau's use of insect analogies to illustrate how humans, like butterflies, can be transformed from the "larval" stage, which relates to the physical world through consumption, to a "perfect" state in which consumption is less important, and in which freedom and contemplation are the ends of life. This transformational idea rests upon a theory, of dynamic dualism in which the animal and the spiritual self remain in tension, but in which the "maturity" of the individual--transcendence of economic demands as imposed by society--emerges through personal growth based on observation of nature. Thoreau's dynamic theory of value, and its attractiveness to environmentalists, explains why environmentalists reject the mainstream, neoclassical economic paradigm. This paradigm accepts consumer preferences as "givens" and treats these preferences as the source of all value in their model. Because Thoreau insists that there is value in transformations from one preference set to another, the neoclassical paradigm cannot capture this central value, and cannot account for the environmentalists' emphasis on public "education" to reduce consumptive demands of humans on their environment. Norton is at the School of Public Policy, Georgia Institute of Technology, Atlanta, GA. (EE)

Norton, Bryan G., "Should Environmentalists Be Organicists?" Topoi (Netherlands) 12(1993):21-30. "Should environmentalists be minimal holists or should they follow their 'spiritual' leader, Muir, in adopting strong, teleological and spiritualistic organicism? First, note that one might consistently say, 'both,' provided the differing interpretations are reconciled as fulfilling different functions. Environmentalists might, in discussing whether to accept a new, less mechanistic worldview let their rhetoric soar with Muir, for example; but they might also, with Leopold, the practitioner who must forge a new management philosophy that will have broad appeal, recognize that such rhetorical flourishes raise

issues that lie beyond easy resolution and content themselves with less difficult intellectual entanglements. My concern here is not with rhetoric, but with forging a vocabulary and set of principles of management that are scientifically respectable and adequate to recognize the dynamic and creative processes that maintain and shape natural systems. Given this goal, a minimal holism points a more promising direction for the future of environmental ethics and environmental policy" (pp. 27-28). A minimal holism will recognize nature as a self-organizing system. Norton teaches philosophy and policy at Georgia Tech. (v6,#4)

Norton, Bryan G., "A Reply to My Critics," *Journal of Agricultural and Environmental Ethics* 20(2007):387-405. Critics of my book, *Sustainability*, have raised many objections which are addressed. In general, I emphasize that the book is an integrative work; it must be long and complex because it attempts a comprehensive treatment of problems of communication, of evaluation, and of management action in environmental discourse. I explain that I depend upon the pragmatists and on work in the pragmatics of language because the current language of environmental policy discourse is inadequate to allow deliberative processes that can reach consensus and cooperative actions. I revise my account of risk analysis somewhat, and defend my broad approach to the concept of sustainability. Finally, I discuss applications of my book to the current situation in environmental policy discourse. Norton is School of Public Policy, Georgia Institute of Technology, Atlanta, GA.

Norton, Bryan, Review of Daniel W. Bromley, *Sufficient Reason: Volitional Pragmatism and the Meaning of Economic Institutions*, *Environmental Values* 16(2007):125-129.

Norton, Bryan G. "Politics and Epistemology: Inclusion and Controversy in Adaptive Management Processes." *Environmental Ethics* 29(2007):299-306. Kevin Elliott has argued that I defend two "conceptions" of adaptive management processes in my book, *Sustainability: A Philosophy of Adaptive Ecosystem Management*, calling the conceptions "political" and "metaphysical," respectively. Elliott claims that I must choose between them. Elliott has not sufficiently explained how he proceeds from the claim that I provide two separable arguments for my adaptive management process to his conclusion that I have two conceptions of this process. Once this confusion is clarified, it becomes clear that adapting a pragmatist grounding for the process (which Elliott refers to as my "metaphysical" conception) is compatible with an open and inclusionary process. Pragmatism, in other words, does not exclude those who adopt ideological approaches to value from the adaptive process; it merely urges them, once in the process, to propose testable hypotheses rather than resort to ideological rhetoric. Norton, Bryan G., ed., The Preservation of Species: The Value of Biological Diversity. Princeton: Princeton University Press, 1986. Pp. xi, 305. A collection of essays written under the auspices of the Center for Philosophy and Public Policy, University of Maryland. An important interdisciplinary collection focused on one of the central problems in environmental ethics: why preserve endangered species? Part I contains articles by Thomas E. Lovejoy, Geerat J. Vermeij, and Stephen R. Kellert which investigate the scientific and social nature of the extinction problem. Part III contains articles by Lawrence B. Slobodkin, Terry L. Leitzell, and Robert L. Carlton that examine concrete management decisions regarding species preservation. The essays in Part II are of the most philosophical interest, for they deal with the ethical justification of species preservation. An economist, Alan Randall, "Human Preferences, Economics, and the Preservation of Species," (pp. 79-109), analyzes species preservation as a problem in resource allocation. Unlike many economic approaches, Randall is sensitive to many

different kinds of human preferences and values that might lead to preservation decisions. Bryan Norton, "On the Inherent Danger of Undervaluing Species," (pp. 110-137), argues that the instrumental reasons for valuing a particular species transcend its inherent properties: there are instrumental reasons for preserving any species in an ecosystem. The diversity of the biosphere is a good that ought to be preserved; thus questions of the extinction of a particular species are not really isolated decisions. J. Baird Callicott, "On the Intrinsic Value of Nonhuman Species," (pp. 138-172), surveys several axiologies that could lend support to the value of nonhuman entities, and decides that the only legitimate basis for an environmental ethic is a kind of Humean/ Darwinian theory based on "bio-empathy." Eliot Sober, "Philosophical Problems for Environmentalism," (pp. 173-194), criticizes a number of rationales for the intrinsic value of natural entities and species, and then offers an argument based on aesthetic properties: nature, like art, should not be destroyed because of our interest in the beautiful--"But it is unclear, then, why we preserve ugly species or ecosystems." Donald Regan, "Duties of Preservation," (pp. 195-220), presents an argument that owes much to G. E. Moore. Regan wants to base the preservation of natural entities on a notion of intrinsic value, but he wants to deny that intrinsic value exists outside of consciousness. His solution is to claim that what has intrinsic value are certain "complexes": a natural entity, a conscious valuer's knowledge of the entity, plus a conscious evaluator's pleasure in that knowledge. Being obligated to preserve such complexes would lead derivatively to preserving natural entities.--"A provocative idea, but clearly based on a major ontological commitment." Bibliography. Norton, Bryan G. "Conservation and Preservation: A Conceptual Rehabilitation." Environmental Ethics 8(1986):195-220. Philosophers have paid little attention to the distinction between conservation and preservation, apparently because they have accepted John Passmore's suggestion that conservationism is an expression of anthropocentric motives and that "true" preservationism is an expression of nonanthropocentric motives. Philosophers have therefore concentrated their efforts on this distinction in motives. This reduction, however, is insensitive to important nuances of environmentalist objectives: there are a wide variety of human reasons for preserving natural ecosystems and wild species. Preservationist policies represent a concern to protect biological diversity from the simplifying effects of human management and are motivated by the full range of values (consumptive, aesthetic, scientific, and moral) attached to a diverse biota. Conservationists and preservationists differ mainly in their emphasis on resilience measures versus predictability measures of stability, respectively. The distinction between anthropocentric and nonanthropocentric motives loses importance as emphasis is placed on the longest term values humans place on the protection of biological diversity. Norton is at the Division of Humanities, New College of the University of South Florida, Sarasota, FL. (EE)

Norton, Bryan, "Sustainability, Human Welfare, and Ecosystem Health." Environmental Values Vol.1 No.2(1992):97-112. ABSTRACT: Two types of sustainability definitions are contrasted. 'Social scientific' definitions, such as that of the Brundtland Commission, treat sustainability as a relationship between present and future welfare of persons. These definitions differ from 'ecological' ones which explicitly require protection of ecological processes as a condition on sustainability. 'Scientific contextualism' does not follow mainstream economists in their efforts to express all effects as interchangeable units of individual welfare; it rather strives to express sensitivity to different types and scales of impacts that present activities can exert on the future. We can therefore express the moral obligation to act sustainably as an obligation to protect the natural processes that form the context of human life and culture, emphasizing those large biotic and abiotic systems essential to human life, health, and flourishing culture. Ecosystems, which are understood as dynamic, self-organizing systems humans have evolved within, must remain 'healthy' if humans are to thrive. The ecological approach to

sustainability therefore sets the protection of dynamic, creative systems in nature as its primary goal. Norton, Bryan G., "Change, Constancy, and Creativity: The New Ecology and Some Old Problems," Duke Environmental Law and Policy Forum 7(1996):49-70. "How are we to conceptualize the rich mix of change and constancy that we encounter in the world of experience?" "The New Ecology emphasizes change and dynamism in ecological systems, claiming that ecology has under-emphasized these features of natural systems. ... (T)he readiness of ecologists to embrace equilibrium theories and to find constancy in ecology events may have deep--perhaps even nonrational--sources. Equilibrium theories may not be empirical theories at all, but rather may represent pre-theoretical assumptions, which are perhaps rooted in a deep, psychological need for stability in the face of threatening changes. ... The intellectual question then becomes one of how to characterize stability and how to reconcile it with the empirically obvious change we experience everywhere. ...

Old Ecologists over-emphasized grand and speculative theory while New Ecologists pay less attention to general principles of ecosystem organization and study particular, local ecological interactions and their outcomes. ... (But) New Ecologists, acting in reaction to the prior over-emphasis on the grand theory of stability in ecological systems, sometimes over-emphasize the importance of change in ecological systems. ... It is not a good idea to pose the question of change versus stability in nature as if there may be an all-or-nothing answer, as if it might turn out that the world is either entirely changing or entirely stable. ... The truth surely is somewhere in between" (pp. 49-55, passim). Norton is in philosophy and public policy at the Georgia Institute of Technology. (v.10,#3)

Norton, Bryan G. and Anne C. Steinemann. "Environmental Values and Adaptive Management," Environmental Values 10(2001):473-506. The trend in environmental management toward more adaptive, community-based, and holistic approaches will require new approaches to environmental valuation. In this paper, we offer a new valuation approach, one that embodies the core principles of adaptive management, which is experimental, multi-scalar, and place-based. In addition, we use hierarchy theory to incorporate spatial and temporal variability of natural systems into a multi-scalar management model. Our approach results in the consideration of multiple values within community-based ecosystem management, rather than an attempt to maximise a single variable such as economic efficiency. We then offer two heuristics - one procedural and one evaluative - to guide a community toward shared goals, and to develop indicators to measure progress toward these goals. We illustrate our approach by application to environmental and developmental decisions in the Southern Appalachians. Keywords: Adaptive management, environmental evaluation, management, multi-criteria analyses, sense of place values. Bryan G. Norton is at the School of Public Policy, Georgia Institute of Technology, Atlanta, GA. Anne C.

Norton, Bryan G. "Pragmatism, Adaptive Management, and Sustainability." Environmental Values 8(1999):451-466. ABSTRACT: The pragmatic conception of truth, anticipated by Henry David Thoreau and developed by C.S. Peirce and subsequent pragmatists, is proposed as a useful analogy for characterising "sustainability". Peirce's definition of "truth" provides an attractive approach to sustainability because (a) it re-focuses discussions of truth and objectivity from a search for "correspondence" to an "external world" (the "conform" approach) to a more forward-looking ("transform") approach; and (b) it emphasises the crucial role of an evolving, questioning community in the conduct of inquiry. Any successful definition of sustainability must share these characteristics with Peircean truth. While Peirce and John Dewey never reconciled their disagreements regarding the nature and task of "inquiry", a pragmatist resolution of their differences is offered, arguing that we need both a logic of management sciences (*logica utens*) and a logic of pure science (*logica docens*), which (perhaps among other differences) respond very differently to uncertainty. It is shown that adaptive management - an important approach to environmental management - can be understood as a first approximation of a *logica utens* for social learning in pursuit of solutions to environmental problems, and it is suggested that a pragmatist, transform approach to inquiry such as Dewey's may provide a way around the "fact-value" gulf. Norton, Bryan G., Toward Unity Among Environmentalists. New York: Oxford University Press, 1991. Norton wants to unite environmentalists in the common cause of environmental protection and appreciation, even though the many environmentalists and environmental groups may have multiple and varied value systems. Despite diverging worldviews, there can be converging policies (the title of a concluding chapter). There are historical chapter studies of Muir, Pinchot, and Leopold, and issue chapters: growth, pollution, biodiversity, and land use, illustrating this thesis. Norton is professor of philosophy at the Georgia Institute of Technology. (v3,#1) Reviewed in Environmental Ethics 14(1992):283-87.

Norton, Bryan G., "Economists' Preferences and the Preferences of Economists." Environmental Values 3(1994):311-332. Economists, who adopt the principle of consumer sovereignty treat preferences as unquestioned for the purposes of their analysis. They also represent preferences for future outcomes as having value in the present. It is shown that these two characteristics of neoclassical modelling rest on similar reasoning and are essential to achieve high aggregatability of preferences and values. But the meaning and broader implications of these characteristics vary according to the arguments given to support these methodological choices. The resulting ambiguities raise questions regarding economists' attitudes towards the study of preference formation and reformation. Under a strong, positivist interpretation (which is philosophically problematic), consumer sovereignty represents a rejection of any

meaningful study of these subjects; under a weaker, methodological understanding, consumer sovereignty merely draws a boundary between economics and other disciplines. The weaker version is argued to be more defensible, and economists are urged to engage in interdisciplinary work that will clarify how preferences are formed, criticized and reformed. KEYWORDS: Consumer sovereignty, economic explanation, preference formation, preferences, value neutrality. Norton is at the School of Public Policy, Georgia Institute of Technology. (EV)

Norton, Bryan G. "Population and Consumption: Environmental Problems as Problems of Scale." Ethics and the Environment 5(2000):23-46. ABSTRACT: Almost every time I teach environmental topics to undergraduate students, at least one student confidently states the opinion that environmental problems are most basically caused by human population growth, and that if we could control population growth, that would be the end of the problems. Although I try never to show how appalled I am by ignorance among students-especially when they are volunteering opinions in a process of thinking through problems-I admit that in these cases I must consciously restrain myself from rebuking the student aloud. What is more appalling is that I fear that this belief is shared by many adults in the United States and perhaps throughout the developed world. This woefully oversimplified formula for understanding environmental problems is not just oversimplified, it is also morally dangerous. When used in conjunction with the apparent fact that industrially developed nations are bringing their population growth under control, the reduction of environmental problems to population problems brings about a not-so-subtle shift of responsibility for existing and emerging environmental problems to the less-developed world. In class, I try to shake the students' complacency about their own role, pointing out to them that, if the blame for environmental damage can be located in the act of parenting, they should realize that each American child born (given current consumption patterns) has 40 to 50 times the environmental impact of a child born in poorer nations. Huge proportions of that consumption are made possible by material flows from less-developed nations of the South into the industrialized North. Even when these material flows bring rapid economic growth, as in Indonesia, for example, the environmental and cultural costs are enormous, and it is often the case that only elites benefit from this growth. (E&E)

Norton, Bryan and Minter, Ben A., "From environmental ethics to environmental public policy: Ethicists and economists, 1973-future." Pages 373-407 in Tom Tietenberg and Henk Folmer, eds., The International Yearbook of Environmental and Resource Economics 2002/2003: A Survey of Current Issues (Cheltenham UK: Edward Elgar, 2002). Environmental ethics has developed with a puzzling ambiguity about the nature of the independence that is asserted for natural intrinsic value and about what types of being can have intrinsic value. "Environmental ethicists have made few contributions to actual discussions about what to do to improve the environment" (p. 374) A more community-based, pluralist approach is needed, centering in "communal values", and worked out with democratic processes and deliberative institutions within which environmental values as communal goods may be advanced. Rich opportunities may open up for collaborations between economists and philosophers, as well as collaborations among these, together with cognitive psychologists, to engage in interdisciplinary research on the development and formation of social values in deliberative situations.

"We ... consider a more radical conceptual innovation, the rejection of moral individualism and the recognition that important environmental values may unfold on the communal scale, a scale that cannot be reduced to individual goods. This more radical innovation encourages a shift in the way we think about environmental values and valuation, shifting attention from ontological questions regarding the nature and measurement of values toward a more politically oriented process approach"(p. 375), specifically C. S. Holling's "adaptive management" (p. 395).

Norton is in philosophy and public policy, Georgia Institute of Technology. Minter is in public policy there.

Norton, Bryan G., "Convergence, Noninstrumental Value and the Semantics of 'Love': Comment on McShane," *Environmental Values* 17(2008):5-14. Katie McShane, while accepting my 'convergence hypothesis' (the view that anthropocentrists and nonanthropocentrists will tend to propose similar policies), argues that nonanthropocentrism is nevertheless superior because it allows conservationists to have a deeper emotional commitment to natural objects than can anthropocentrists. I question this reasoning on two bases. First, McShane assumes a philosophically tendentious distinction between intrinsic and instrumental value - a distinction that presupposes a dualistic worldview. Second, I question why McShane believes anthropocentrists - weak anthropocentrists, that is - cannot 'love' or 'feel awe' toward natural objects. Her argument, that is, only works against strong anthropocentrism, which I never advocated.

Norton, Bryan G. *Sustainability: A Philosophy of Adaptive Ecosystem Management*. Chicago: University of Chicago Press, 2005. Beginning with his experiences as a philosopher working at the Environmental Protection Agency, Norton argues that the central problem of environmentalism and environmental protection is a lack of effective communication. Following his interpretation of Aldo Leopold as an anthropocentric holist, environmental pragmatist, and adaptive manager, Norton critiques both environmental economics and intrinsic value approaches to environmental ethics and, in their place, develops a theory of environmental values as community commitments and a normative vocabulary that will encourage interdisciplinary communication and social learning about environmental problems. Norton's adaptive ecosystem management is an American pragmatist-inspired account of experience, truth, and language motivated by the social values of democratic communities. He defines sustainability as "a relationship between generations such that the earlier generations fulfill their individual wants and needs so as not to destroy, or close off, important and valued options for future generations" (p. 363). Environmental philosophers should no longer articulate values but instead should only offer heuristics and linguistic choices to help improve communication among the stakeholders of democratic communities. The field of environmental ethics becomes a subfield of adaptive management science.

Norton, Bryan. "Objectivity, Intrinsicity and Sustainability: Comment on Nelson's Health and Disease as 'Thick' Concepts in Ecosystemic Contexts." *Environmental Values* 4(1995):323-332. Ecosystem health, as James Nelson argues, must be understood as having both descriptive and normative content; it is in this sense a 'morally thick' concept. The health analogy refers (a) to the similarities between conservation ecology and medicine or plant pathology as normative sciences, and (b) to the ability of ecosystems to 'heal' themselves in the face of disturbances. Nelson, however, goes beyond these two aspects and argues that judgements of illness in ecosystems only support moral obligations to protect them if they are attributed a 'good of their own'. But this latter extension of the analogy flies in the face of ecological science, which has been forced to abandon organicism. If one separates the question of the warranted assertibility of environmentalists' goals from the question of where values in nature are located, the search for an objective realm of value realism can be seen to be unnecessary. KEYWORDS: Ecosystem health, intrinsic value, objectivity, organicism. Norton is in the School of Public Policy, Georgia Institute of Technology. (EV)

Norton, Bryan. *Searching for Sustainability: Interdisciplinary Essays in the Philosophy of Conservation Biology*. New York: Cambridge University Press, 2003. 27 of Norton's essays, some with co-authors. Philosophical and environmental pragmatism. Environmental policy with an eye toward sustainability. If we properly treat human values and concerns for future generations, including our desire for their opportunities, then we arrive at policies that are essentially identical to those advocated by defenders of

intrinsic value in nature (Norton's "convergence hypothesis"). Adaptive environmental management and hierarchy theory (smaller more dynamic ecosystems are embedded within larger, more stable systems). Conservation biologists should see themselves as engaged in a normative science. (v. 15, # 3)

Nunez, Theodore W., Holmes Rolston, Bernard Lonergan, and the Foundations of Environmental Ethics. Ph.D. Thesis, 1999, Catholic University of America, Washington. The ecophilosophy of Holmes Rolston in dialogue with the thought of Canadian Jesuit philosopher Bernard Lonergan in an attempt to clarify and develop the foundations of a contemporary environmental ethic.

Part I. An interpretive analysis of Rolston's major writings. His meta-ethical positions in the areas of

epistemology, metaphysics, axiology, and philosophical anthropology. Rolston's interpretive natural history and its relation to his theology of nature. Rolston defends a critical-realist epistemology as the meta-ethical basis for a science-based, ecocentric ethic. His most important epistemological claim is that human beings are capable of worldview-formation, moral oversight, and planetary altruism.

Part II. Aspects of Lonergan's philosophy relevant to environmental ethics: cognitional theory, transcendental method, and critical-realist epistemology. Cognitive and moral objectivity is the fruit of authentic subjectivity. Lonergan's theory of emergent probability and the related notions of development and finality. Lonergan's dialectic of progress, decline, and redemption in history and society. Lonergan's view of the humanity-nature relationship clarified and developed by drawing on Robert Doran's related notions of an ecological differentiation of consciousness, an integral dialectic of culture, and psychic conversion.

Part III. In a mutually critical dialogue between Rolston and Lonergan on foundational issues in environmental ethics, each thinker complements and corrects the other in several ways. (1) Critical realism offers the most adequate epistemological grounding for environmental ethics. (2) Meeting the eco-social crisis requires a new, nonanthropocentric ethic that is scientifically informed and religiously based (a theocentric ethic). (3) It is both necessary and possible for a new environmental ethic to integrate a nonanthropocentric theory of values in nature with a humanistic value theory. (4) A new ethic must include, as a central component, a character ethic informed by an evolutionary epic and a normative vision of sensitive earth residence.

A summary argument, with commentaries, appears as "Rolston, Lonergan, and the Intrinsic Value of Nature," Journal of Religious Ethics 27 (no. 1, Spring, 1999):105-128. See that entry. (v.10,#2)

Nunez, Theodore W., "Can a Christian Environmental Ethic Go Wild? Evaluating Ecotheological Responses in the Wilderness Debate," pages 329-349 in Kelsay, John and Twiss, Sumner B., eds., The Annual of the Society of Christian Ethics 2000, vol. 20. (Washington, DC: Georgetown University Press, 2000). Postmodern ecophilosophers argue that the wilderness idea, specifically the Euro-American conception of pristine nature derived from Muir and inscribed in the 1964 Wilderness Act, is ethnocentric, elitist, androcentric, and unjust. Although the value of existing wilderness areas is not questioned, the background assumptions and policy implications of the received wilderness concept are. This essay first reviews several postmodern critiques of and alternatives to the wilderness idea, and then examines the responses of two leading ecotheologians, Larry Rasmussen and Sallie McFague, to postmodern themes in contemporary ecophilosophy. It concludes by outlining what it might mean for a Christian environmental ethic to go wild. Nunez teaches ethics at Villanova University. (EE v.12,#1)

Nunez, Theodore W. Review of Genes, Genesis and God: Values and Their Origins in Natural and Human History. By Holmes Rolston, III. Environmental Ethics 22(2000):111-112.

Nunez, Theodore W., "Rolston, Lonergan, and the Intrinsic Value of Nature," Journal of Religious Ethics 27 (no. 1, Spring, 1999):105-128. In recent metaethical debate over ways to justify the notion of intrinsic natural value, some neopragmatists have challenged realist conceptions of scientific and moral truth. Holmes Rolston defends a critical-realist epistemology as the basis for a metaphysics of "projective nature" and a cosmological narrative--both of which set up a historical ontology of objective natural value. Pure ecological science informs the wilderness experience of Rolston's ideal epistemic subject, the

"sensitive naturalist." Nunez argues that Rolston's account of the relation between knowing and valuing can be clarified and strengthened by appropriating Bernard Lonergan's transcendental method. Conversely, Lonergan's view of moral self-transcendence can be developed further in light of Rolston's virtue epistemology, which is embodied in the figure of the sensitive naturalist. Key words: critical realism, environmental ethics, epistemology, intrinsic value, value theory.

The commentaries are:

--Frankenberry, Nancy, "On Empty Compliments and Deceptive Detours: A Neopragmatist Response to Theodore W. Nunez," Journal of Religious Ethics 27 (no. 1, Spring, 1999):129-136. Neopragmatist reasons for repudiating metaphysical realism's notions of intrinsicity and subject-independent reality. Following the holism of Donald Davidson and Richard Rorty rather than the epistemological premises of Holmes Rolston and Bernard Lonergan, coping with the ecological crisis does not require conjuring up an epistemic crisis. Environmental ethics in neopragmatist hands would seek procedures for bringing about agreement in improving our practices, not our epistemology. Frankenberry is in religion at Dartmouth College, Hanover, NH.

--Jackson, Timothy P., "Ambivalences about Nature and Naturalism," Journal of Religious Ethics 27 (no. 1, Spring, 1999):137-144. A "die-hard supernaturalist," someone "at two with nature" who would be "at one with God" has mixed feelings about Theodore Nunez's defense of naturalism. Unlike neopragmatists, Jackson is not troubled by Nunez general realism about value; he takes exception not to Nunez theoretical account of truth, but to his specific axiology. Jackson does not share Nunez's confidence that Rolston's "projective nature" can provide reliable moral inspiration. Instead such inspiration can arise only from the holiness of God. Jackson teaches ethics at Candler School of Theology, Emory University, Atlanta.

--Nunez, Theodore W., "The Author Replies," Journal of Religious Ethics 27 (no. 1, Spring, 1999):145-148. (v.10,#2)

Nygren, Anja, "Environment as Discourse: Searching for Sustainable Development," Environmental Values 7(1998): 201-222. This study analyses the social and political discourses related to environment and sustainable development in Costa Rica. The central interest is on those development institutions and ideologies that promote social interventions in the name of sustainable development, and on those social processes and economic relations on which the discursive formation of environment and sustainability is articulated. Four different kinds of ideologies of environmental sustainability are analysed: Environmentalism for Nature, Environmentalism for Profit, Environmentalism for the People, and Alternative Environmentalism. The study highlights the complexity of political discourses that construct the relationship between nature and society, and the multiplicity of the means by which the control over natural resources, within the internally differentiated development apparatus, is defined. KEYWORDS: sustainable development, environmentalism, Costa Rica, access over resources. Anja Nygren is at the University of Helsinki, Finland. (EV)

Nygren, Anja, "Representations of Tropical Forests and Tropical Forest-Dwellers in Travel Accounts of National Geographic," Environmental Values 15(2006): 479-504. As one of the most widely read genres of literature, travel writing plays a crucial role in forming popular images and understandings of foreign

places and foreign peoples. This essay examines the dominant images of rainforests and rainforest peoples portrayed in accounts of travels in tropical America published in National Geographic. Special attention is paid to the issues of how particular representations are privileged in this magazine's travel accounts and how these representations relate to questions of authority and power. The analysis shows that the prevailing representations of the tropical forests and tropical forest-dwellers in the travel accounts of National Geographic rely on historically changing, but equally categorical distinctions between 'good' and 'bad', and 'natural' and 'unnatural'. Nylund, Are, Arne Selvik, Gunnar Skirbekk, Andreas Steigen, and Audfinn Tjonneland, The Commercial Ark: A Book on Evolution, Ecology, and Ethics. Oslo: Scandinavian University Press, 1992; distributed elsewhere by Oxford University Press). (In English) Hardcover. 150 pages. ISBN 82-00-21602-0. A project of the Norwegian Academy of Arts and Sciences. A modern fable about the survival of life on earth, with the basic idea of the earth as our common ark. Sometimes lighthearted and amusing, always with a serious purpose. Dealing with such topics as ecology, economy, and ethics, the authors introduce the Commercial Ark, her crew, her passengers, and what happened to them. There can be no doubt, should the Great Flood threaten us today, things would be handled quite differently than in old Noah's time. "Our Commercial Ark is still afloat. It remains our only home in a silent universe, as it is the only home, oikos, of all other species, our common oiko-sphere. Should it end like a ship of fools? Or should it become an oiko-logical ark? To this question there is no answer in Holy Scripture. The answer lies in our hands" (p. 148). (Norway)

O'Neil, Sean Samuel, Review of John Hart, *Sacramental Commons: Christian Ecological Ethics* (Lanham, MD: Rowman and Littlefield, 2006). *Journal of Agricultural and Environmental Ethics* 21(2008):491-494.

O'Neill, John, Alan Holland, and Andrew Light. *Environmental Values*. London: Routledge, 2008. In order to address value conflicts, the authors begin with an explication and critique of utilitarianism which, through welfare economics and cost-benefit analysis, has dominated much public policy making. They find utilitarianism problematic for a number of reasons, including utilitarianism that relies upon moral monism. They also problematize nonanthropocentric approaches to environmental ethics that rely upon a form of moral monism—including biocentric moral considerability and realist accounts of intrinsic value. The authors defend a pluralistic alternative that is rooted in the everyday relations of humans to the environment; this allows human needs to be integrated with environmental protection through an understanding of the history and narrative of particular places. They conclude with the implications of their theory of environmental values for biodiversity conservation, sustainability, and public decision-making.

O'Neill, John, "Happiness and the Good Life," *Environmental Values* 17(2008):125-144. Holland argues that environmental deliberation should return to classical questions about the nature of the good life, understood as the worthwhile life. Holland's proposal contrasts with the revived hedonist conception of the good life which has been influential on environmentalism. The concept of the worthwhile life needs to be carefully distinguished from those of the happy life and the dutiful life. Holland's account of the worthwhile life captures the narrative dimension of human well-being which is revealed but inadequately addressed by hedonic research. Environmental concerns are better understood from a non-hedonist

perspective. An Aristotelian version of this perspective also offers the institutional focus which Holland suggests is required in environmental deliberation.

Oates, David, Earth Rising: Ecological Belief in An Age of Science. Corvallis: Oregon State University Press, 1989. Pp. 255. A well-written explanation and analysis of the fundamental features of ecological thinking and their philosophical implications. Oates explains the basic scientific foundations of the ecological world view and how these lead to the development of an environmental ethic. The end of the book contains a criticism of deep ecology, for its alleged rejection of scientific thinking, and for the theoretical quibbling that merely splinters the green movement. Oates is concerned that environmental philosophers exhibit "intellectual imperialism---the insistence that there is only one correct position" (p. 206). This attitude does not bother philosophers, who accept it as part of the business; but it is useful to see how serious non-philosophers view the process of philosophical argument and analysis which we perceive as the search for truth and clarity. OBriant (O'Briant), Walter H. "Leibniz's Contribution to Environmental Philosophy." Environmental Ethics 2(1980):215-20. In this essay I survey the philosophy of the seventeenth-century German thinker Gottfried Leibniz as a preliminary to eliciting some of the implications of his views for environmental philosophy. Reference is also made to the views of the ancient atomists, Bacon, Descartes, Hobbes, Locke, and Spinoza. O'Briant is at the department of philosophy and religion, University of Georgia, Athens, GA. (EE)

OBrien (O'Brien), Stephen J. and Ernst Mayr, "Bureaucratic Mischief: Recognizing Endangered Species and Subspecies," Science, March 8, 1991. The Florida panther, the gray wolf, the red wolf, and the dusky seaside sparrow (now extinct) all involve hybrid populations and there is confusion about species,

subspecies, and hybrids. O'Brien and Mayr claim that the biological species concept, species as "groups of actually or potentially interbreeding populations that are reproductively isolated from other such groups" can be applied to subspecies to formulate a hybrid policy. "Biological species do not form hybrids that disintegrate population genetic organization, but subspecies may. The Hybrid Policy of the Endangered Species Act should discourage hybridization between species, but should not be applied to subspecies because the latter retain the potential to freely interbreed as part of ongoing natural processes. Upon the discovery of coyote DNA in Midwest wolves last year, State Farm Bureaus in Idaho, Montana, and Wyoming petitioned the United States Fish and Wildlife Service to remove the grey wolf from the endangered species list, since it was a hybrid species, not protected under the Endangered Species Act. The petition was turned down, and the Service is drafting a policy as to what is and what is not a hybrid. O'Brien is a geneticist with the National Cancer Institute and Mayr is professor of zoology at Harvard University. See entry below in "Issues" on Florida panthers. (v2,#1)

O'Brien (O'Brien), James F. "Teilhard's View of Nature and Some Implications for Environmental Ethics." Environmental Ethics 10(1988):329-46. Teilhard's cosmological speculation is a valuable basis for an environmental ethics that perceives individual natural objects as good in themselves and the world as good in itself. Teilhard perceives man as fundamentally part of a cosmic environmental whole that is greater than mankind taken individually or collectively. His holistic views on human biological and psychological and social evolution are, I argue, compatible with a biocentric environmental ethics. I discuss some similarities and differences with the views of the deep ecology movement. I show that Teilhard's hierarchical system is not humanistically oriented in a way that need be interpreted by Teilhardians as contrary to environmental well-being. I argue that Teilhard's sympathy toward transportation technology, including the automobile, can be interpreted in his holistic manner. I conclude that Teilhard's theocentric views are also a basis for supporting an environmental ethics which is both optimistic and not anthropocentric. O'Brien is in the philosophy department, Villanova University, Villanova, PA. (EE)

O'Brien (O'Brien), Marianne, "The Aesthetic Significance of Nature's Otherness," Environmental Values 15(2006): 99-111. In this article I consider and reflect upon the aesthetic significance of Simon Hailwood's conception of nature as articulated in an earlier volume of this journal in his paper 'The Value of Nature's Otherness' (Hailwood 2000: 353-72). I provide a brief elucidation of Hailwood's conception of nature as other and I maintain that recognition of the value of nature's otherness and respect for nature's otherness requires as a necessary condition that one know and perceive that nature is other. I then go on to consider Hailwood's concerns over the possibility of locating nature's value as other in aesthetic responses to nature. I argue that such reservations are warranted insofar as they focus on an inadequate 'subjectivist' account of aesthetic experience but are not warranted for all accounts of aesthetic experience, in particular, I will argue that such reservations do not apply to the 'cognitive' model of aesthetic appreciation proposed by Allen Carlson as the 'environmental model' and developed in the work of Yuriko Saito. I conclude this paper by claiming that aesthetic value is a necessary component of otherness as a ground of nature's value and that this needs to be conceded if we are to be able to acknowledge the reality of something other than ourselves, to treat it appropriately and with respect. (EV)

O'Brien, Mary, Making Better Environmental Decisions An Alternative to Risk Assessment. Cambridge, MA: MIT Press, 2000. Proposes to replace "risk assessment" with "alternatives assessment." We should

not ask: "How much of a hazardous activity is safe, of insignificant harm, or 'acceptable'?" But: "What are our options for least harm, and the greatest restoration?" This book is not based on the academic risk assessment literature, but on the actual experiences of crucial public environmental decisions based on risk assessment, without looking at the pros and cons of a full range of reasonable alternatives. We should all take a "consumer reports" approach to decision-making. Just as the well-known consumer magazine examines a range of available options before recommending a particular toaster or TV, all decision-makers (public and private) should examine a full range of options before committing to a new project or new technology. The least-damaging option should be chosen. But that is not how decisions are made in the industrialized world. Instead of examining a full range of alternatives, decision-makers generally decide what they want to do, then they hire a risk assessor to convince everyone that the damage they are about to do is "acceptable." By the time damage becomes apparent, they are hauling loot to the bank. At that point, stopping them is almost impossible. The cumulative result of this "risk-based decision-making" is a severely degraded and stressed global ecosystem. O'Brien is a consultant on alternatives to risk assessment and to the use of toxic chemicals. She has been a staff scientist for the Environmental Research Foundation and for the U.S. office of the Environmental Law Alliance. (v.11,#4)

O'Connor (O'Conner), Martin, ed. Is Capitalism Sustainable? Political Economy and the Politics of Ecology. Review by Andrew Dobson, Environmental Values 7:(1998):488.

O'Connor (O'Connor), Martin, "Valuing Fish in Aotearoa: The Treaty, the Market, and the Intrinsic Value of the Trout." Environmental Values 3(1994):245-265. New Zealand fisheries management reforms are being conducted in terms of 'balancing' of interests and reconciliation of conflicting claims over ownership and use. Fisheries legislation seeks efficient levels of fishing effort, while establishing 'environmental bottom lines' for stock conservation; resource management law requires, alongside efficiency of resource use, consideration for species diversity and 'the intrinsic values of ecosystems' (notably the 'protection of the habitat of trout and salmon'); and the Treaty of Waitangi safeguards customary practices and life-support requirements (including fisheries) for the Maori people. This paper analyses these antinomies in terms of contrasting ethical positions - utilitarian (self-interested, instrumental) rationality, versus an ethic of reciprocal hospitality - and shows how fisheries management policies can be formulated on this basis. KEYWORDS: Aotearoa, fisheries legislation, habitat protection, hospitality, Treaty of Waitangi. O'Connor is at the University of Auckland, New Zealand. (EV)

Odell, J., Mather, M. E. and Muth, R. M., "A Biosocial Approach for Analyzing Environmental Conflicts: A Case Study of Horseshoe Crab Allocation," Bioscience 55(no. 9, September 2005): 735-748. Ambiguous legislation, insufficient science, jurisdictional disputes, and conflicting values of stakeholders have contributed to the increasing frequency of natural resource conflicts. The allocation of horseshoe crabs in Delaware Bay and Cape Cod Bay can serve as a model system for understanding resource conflicts, because relationships among biophysical and human systems in this example typify many environmental controversies. Herein, we use an interaction web to build a conceptual framework for identifying potential conflicts. Specifically, we identify four subconflicts involving horseshoe crabs, human shellfishers, commercial fishers, the biomedical industry, birdwatchers, and environmental interest groups. Stakeholders hold different attitudes concerning the horseshoe crab and thus advocate competing policy preferences in the political process. An important step in understanding environmental conflicts is to clarify differences in social meanings, attitudes, and values. The integrated approach described here, by depicting and graphically displaying biosocial relationships, can provide a generalized approach for understanding a broad range of environmental conflicts.

Odenbaugh, Jay, Values, "Advocacy and Conservation Biology," Environmental Values 12(2003): 55-69. I examine the controversy concerning the advocacy of ethical values in conservation biology. First, I argue, as others have, that conservation biology is a science laden with values both ethical and non-ethical. Second, after clarifying the notion of advocacy at work, I contend that conservation biologists should advocate the preservation of biological diversity. Third, I explore what ethical grounds should be used for advocating the preservation of ecological systems by conservation biologists. I argue that conservation biologists should defend their preservationist positions on instrumentalist grounds alone if the context of discussion and debate is a scientific one. (EV)

Odin, Steve. "The Japanese Concept of Nature in Relation to the Environmental Ethics and Conservation Aesthetics of Aldo Leopold." Environmental Ethics 13(1991):345-60. I focus on the religio-aesthetic concept of nature in Japanese Buddhism as a valuable complement to environmental philosophy in the West and develop an explicit comparison of the Japanese Buddhist concept of nature and the ecological world view of Aldo Leopold. I discuss the profound current of ecological thought running through the Kegon, Tendai, Shingon, Zen, Pure Land, and Nichiren Buddhist traditions as well as modern Japanese philosophy as represented by Nishida Kitaro and Watsuji Tetsuro. In this context, I present the Japanese concept of nature as an aesthetic continuum of interdependent events based on a field paradigm of reality. I show how the Japanese concept of nature entails an extension of ethics to include the relation between humans and the land. I argue that in both the Japanese Buddhist concept of nature and the thought of Aldo Leopold there is a hierarchy of normative values which grounds the land ethic in a land aesthetic. I also clarify the soteric concept of nature in Japanese Buddhism by which the natural environment becomes the ultimate locus of salvation for all sentient beings. In this way, I argue that the Japanese Buddhist concept of nature represents a fundamental shift from the egocentric to an ecocentric position--i.e., a de-anthropocentric standpoint which is nature-centered as opposed to human-centered. Odin is in the philosophy department, University of Hawaii at Manoa, Honolulu, HI. (EE)

Odum, Eugene, Ecological Vignettes: Ecological Approaches to Dealing with Human Predicaments.

Amsterdam, The Netherlands: Harwood Academic Publishers, 1998. 1. What we learn from ecology about growth. 2. What we learn from ecology about energy. 3. What we learn from ecology about organization. 4. What we learn from ecology about change. (There are checks and balances but no equilibria in nature). 5. What we learn from ecology about behavior. 6. What we learn from ecology about diversity. 7. Human ecology: What we don't learn from nature. (Money is a very incomplete measure of wealth.) 8. Bottom lines. An introductory section followed by twenty-six essays, some co-authored, a few by other authors, mostly previous published. Sample: "How to prosper in a world of limited resources: Lessons from coral reefs and forests on poor soils." Odum is with the University of Georgia Institute of Ecology. This and Frank Golley's A Primer for Ecological Literacy (Yale University Press), see previous newsletter, offer two of the most famous ecologists at the University of Georgia in a philosophical turn of mind. This worth getting in your college or university library and it might not show up there through the usual purchasing channels. (v.10,#1)

Oechsli, Lauren, and Eric Katz. "Moving beyond Anthropocentrism: Environmental Ethics, Development, and the Amazon." Environmental Ethics 15(1993):49-59. We argue for the rejection of an anthropocentric and instrumental system of normative ethics. Moral arguments for the preservation of the environment cannot be based on the promotion of human interests or goods. The failure of anthropocentric arguments is exemplified by the dilemma of Third World development policy, e.g., the controversy over the preservation of the Amazon rain forest. Considerations of both utility and justice preclude a solution to the problems of Third World development from the restrictive framework of anthropocentric interests. A moral theory in which nature is considered to be morally considerable in itself can justify environmental policies of preservation, even in the Third World. Thus, a nonanthropocentric framework for environmental ethics should be adopted as the basis for policy decisions. Katz and Oechsli are at the Center of Technology Studies, New Jersey Institute of Technology, Newark, NJ. (EE)

Oelhaf, Robert C. "Environmental Ethics: Atomistic Abstraction or Holistic Affection?" Environmental Ethics 1(1979):329-39. For conventional economics things have value only to the degree that they give pleasure to individual human beings. In response to continuing environmental deterioration several alternatives have been offered for valuing resources and allocating them between generations. Most of these approaches are highly abstract. The deterioration of the Earth and the mistreatment of its inhabitants will not be stemmed by abstractions. Neither will abstract ideas direct us to the best use of our resources. We need to foster personal relationships between human beings and particular portions of the Earth. Oelhaf is at the Kimberton Farms School, Kimberton, PA. (EE)

Officer, Charles B., and Page, Jake, Tales of the Earth: Paroxysms and Perturbations of the Blue Planet. New York: Oxford University Press, 1993. 226 pages. The Earth-shattering events that have changed the course of history. The Tambora volcanic eruption of 1815 in Indonesia, which, a year later, caused snow to fall brown, blue, and red halfway around the world. The Lisbon earthquake of 1755, which sparked the famous clash between Voltaire and Rousseau over the meaning of disaster. The Earth is still hot and mobile, and its surface moves around. Flooding events. Visitors from outer space. On rare occasions there are big changes in Earth's community of living things.

The closing section are on the human capacity for wreaking equally great changes on a global scale. "The most fundamental question facing mankind today is whether man can evolve to live in harmony with nature" (Chapter 9) "Human beings, and, in particular, in the last couple of centuries of their existence, have brought about a new type of environmental stress. The most outstanding characteristic of this stress is the rapidity with which it has grown. Virtually nothing in the geological record can compare with these rapid changes: we are changing the Earth's environment far faster than natural forces have done in the past" (p. 205). "The time has come to recognize that the most pressing need is to learn to live in harmony with the planet and its resources, not simply to plunder and overrun it" (pp. 212). But too many still operate with an "ethics of ignorance" (p. 209). (v.9,#4)

Ogden, John C., "Maintaining Diversity in the Oceans: Issues for the New U.S. Administration," Environment 43(no.3, April, 2001): 28-. The notion of the ocean as an inexhaustible resource is being exploded by the realities of overfishing, habitat destruction, coastal population growth, and ocean warming. Cooperation among nations, states, and organizations is essential to maintain marine diversity. (v.12,#3)

OGrady (O'Grady), John P., Pilgrims to the Wild: Everett Ruess, Henry David Thoreau, John Muir, Clarence King, Mary Austin. Logan: University of Utah Press, 1993. Paper. \$ 16.95. "A series of meditations focused upon literary excursions into 'the wild' ... The fundamental assumption I employ--call it a perception--is that the wild is erotic space, and the pilgrimages I am concerned with are journeys through that space." O'Grady is professor in a wilderness literature program at the University of California, Davis. (v4,#2)

Ogrin, Dusan, ed., Nature Conservation Outside Protected Areas/ Varstvo narave zunaj zavarovanih obmocij: Proceedings of the International Conference on the Occasion of the European Year of the Environment, 1995. Ljubljana, Slovenia: Ministry of Environment and Physical Planning, Republic of Slovenia, and Institute for Landscape Architecture, Biotechnical Faculty, University of Ljubljana 1996. 247pp. ISBN 961-90033-9-X. All articles are in both Slovenian and English. Contents: Pavle Gantar,

"Introductory Speech"; Mario Pavan, on a political democracy of the environment for a better Europe (in French); Holmes Rolston, III, "Nature, Culture, and Environmental Ethics"; Ivan Marusic, "Towards a General Conservation Theory"; Peter Jacobs, "Environmental Parentheses and Design Metaphors"; Kazuhiko Takeuchi, "Planning for the Recovery of Nature in Rural and Urban Areas"; Harald Plachter, "A Central European Approach for the Protection of Biodiversity"; Hans Kiemstedt, "Landscape Planning and Impact Regulation as Instruments of Integrated Nature Conservation in Germany"; Olav Skage, "Nature Conservation Through Landscape Planning"; Carl Steinitz, "Landscape Planning and the Management of Biodiversity"; Shumel Burmil, "Protection of Nature Outside Protected Areas in Israel"; Martin Schneider-Jacoby, "Nature Conservation Efforts for Rivers in Central Europe"; Mladen Berginc, "The Nature Conservation System in Slovenia"; Margita Jancic, "The Role of Physical Planning Instruments in Guaranteeing Conservation Interests"; Jana Vidic, "Natural Values Outside Protected Areas"; Zivzn Veselic, Saso Golob, "Nature Conservation Represents an Integral Part of Forest Managing in Slovenia"; Dusan Ogrin, "Dilemmas in an Approach to Conservation Planning"; Ana Kucan, "The Green System of Ljubljana in the Social, Ecological and Morphological Role"; Davorin Gazvoda, "A Conservation of Urban Open Space in a Perspective of Persistent Urban Landscapes." Ogrin teaches landscape architecture at the University of Ljubljana, Slovenia. This conference was held under the auspices of the Council of Europe. (v7,#4)

Ohara (O'Hara), Sabine U., "Sustainability: Social and Ecological Dimensions," Review of Social Economy 53(no. 4, 1995):529-551). Sustainability has generated many and often conflicting definitions. An overlooked dimension is the importance of the "informal" or household sector. To move toward sustainability it is imperative to regain a broader understanding of economics. Three principles are needed for this expansion of understanding: concreteness rather than abstraction; connectedness rather than isolation; and diversity rather than homogeneity. All three are informed by feminist theory. O'Hara is at Rensselaer Polytechnic Institute, Troy, NY. (v.10,#2)

O'Hear, Anthony, "The Myth of Nature." Pages 69-80 in Barnett, Anthony and Scruton, Roger, eds., Town and Country (London: Jonathan Cape, 1998). The vexed and complex question of our relationship to the natural world is not helpfully addressed by reliance on a naive sense of the natural as opposed to the human or the artificial. Nature is accorded a religious aura and the artificial is suspect. That some activity or thing is more natural than some other is no cause to value it more highly. "The invocation of the natural does evoke a powerful quasi-religious aura: we are dealing with a myth which for once really does need deconstruction" (p. 71)

"For Aristotle, man is by nature a political animal, meaning that only in a city or polis will certain activities, fundamental to human flowering take place, and this, of course, requires artifice" (p. 72). But Aristotle lived in a cosmos with an overall end, and that is no part of current Darwinian understanding of nature. "The picture which biology paints of nature and the natural world is in stark contrast to the idea which captivates the popular mind--namely that what is natural is in some sense pure and normal, and that we should aspire to this condition" (pp. 74-75). Present human population levels can be supported only with much technology and artifice.

"We are of course interested in the survival of our children and their children, and in the survival of the human race. Equally for aesthetic, utilitarian and moral reasons, biodiversity and conservation are important. But do not let us deceive ourselves or our children into thinking that there is anything 'natural' about these latter concerns, or that promoting them though conservation demands that we adopt a mystical or sentimental or unscientific attitude to 'nature,' marked off in some Manichean way from science and human intervention. In fact, rather to the contrary, the truth is that only an intelligent, informed and interventionist approach to nature will promote either conservation or the other goals we have" (pp. 78-79). O'Hear is in philosophy, University of Bradford, UK. (v.13, #3)

Ohio Humanities Council, The, has published, "Environmental Crisis and Morality," a reading program written by Norman S. Care, professor of philosophy at Oberlin College. The pamphlet is addressed to

literate nonphilosophical persons and is especially good for making the crossover from popular concern for nature and environmental issues into a more philosophical approach to environmental ethics. Care introduces five books: Thoreau's Walden, Leopold's Sand County Almanac, Partridge's Responsibilities to Future Generations, 's Philosophy Gone Wild, and Regan's Earthbound. Designed for a discussion evening and useful as a take-home handout to get persons started in environmental ethics. The Council has also produced two other pamphlets: "American Environmental History" by Clayton Koppes and "Readings in Environmental Literature" by Lawrence Buell. For single copies, contact the Ohio Humanities Council, P. O. Box 06354, Columbus, OH 43206-0354. Phone 614/461-7802. (v1,#2)

Ohio Humanities Council, The, has also produced a series of twelve posters under the general title Upstream/Downstream in Ohio. Each poster focuses the viewer's attention on key environmental issues and questions. 1. Upstream/Downstream in Ohio. The river major rivers in Ohio, and the name Ohio derived from a native American term for "beautiful river." 2. The Changing Face of Ohio. Natural history reshaped by agriculture and industry. 3. Earthly Visions. Anticipations of the early settlers. 4. The Cost of Coal. Degradation of land and air from mining. 5. A Sense of Nature's Limits. Floods and waste in the waters. 6. Individual Choices on Common Ground. The exercise of individual freedom and environmental responsibility. 7. After the Harvest. Wetlands and water pollution from agriculture. 8. Shared Resources, Common Concerns. Lake Erie and the Great Lakes. 9. Prospects for Renewal. Restoring the Cuyahoga River. 10. The Stress of Growth. The quality of life in cities depends on intelligent use of land, water, air. 11. The Toll of Transportation. The benefits and costs of car and rail. 12. A Time for Choices. Past decisions have reshaped the landscape. What of the future? In a sense we all live both upstream and downstream from other generations that pass before and after us on the river of time. The poster series is quite well done and serves to stimulate thought, either by individual viewers or in discussion groups. There is a discussion guide. An excellent example of imaginative use of posters for environmental education, which might well be imitated in other regions, especially in more developed areas. (v1,#2)

Oksanen, Markku, Nature as Property: Environmental Ethics and the Institution of Ownership. Turku, Finland: Reports from the Department of Practical Philosophy, University of Turku, Volume 10, 1998. ISSN 0786-8111. ISBN 951-29-1191-4 This is Oksanen's Ph.D. thesis, done under the supervision of Juhani Pietarinen of the Department of Philosophy, University of Turku, Finland, Summer 1998. A study of the conceptual and practical implications of the institution of ownership, when ecological concerns are profoundly taken into account. The Western understanding of, and the attitude to, nature are changing and the change may extend to concern the institution of ownership. Particularly land ownership is in many cases directly related to the emergence of ecological problems. What is at stake in environmental ethics is primarily the same as what is at stake in the philosophy of ownership: the use of the physical environment, the goods and services nature provides.

We can identify in two complementary ways the points of contradiction between the advocates of the environment and those of private property. Firstly, the conflict centres upon the ideas of proper human attitudes to, and treatment of the natural world. Can natural things be owned? On what grounds are they ownable? Secondly, assuming that natural objects are ownable, we face the issue of how to apply these norms in practice and how to resolve a conflict between these two sets of norms. In sum, how

is the natural world to be treated?

Oksanen, Markku, Review of: William Throop (ed.), Environmental Restoration, and Paul H. Gobster and R. Bruce Hull (eds.), Restoring Nature: Perspectives from the Social Sciences and Humanities, Environmental Values 11(2002):249-250.

Oksanen, Markku and Elisa Aaltola, "Species Conservation and Minority Rights: The Case of Springtime Bird Hunting in Åland," Environmental Values 11(2002):443-460. The article examines the case of springtime bird hunting in Åland from a moral point of view. In Åland springtime hunting has been a cultural practice for centuries but is now under investigation due to the EU Directive on the protection of birds. The main question of the article is whether restrictions on bird hunting have a sound basis. We approach this question by analyzing three principles: The animal rights principle states that if hunting is not necessary for survival, it cannot be morally justified. Therefore hunting merely to engage in a cultural custom is morally suspect. In the light of the species conservation principle the hunting is questionable due to the fact that it seems to have a diminishing effect on the species populations. The formal principle of justice makes up a more difficult question since the special position of the minorities in regard to the use of natural resources is generally recognised so that they have the right to maintain their cultural practices. We claim, however, that even though cultural practices have substantial value and can be the object of special rights, they should be coherent with other principles. The springtime bird hunt in Åland does not accord with the relevant moral principles and for this reason we conclude that the basis for its continuation is weak. (EV)

Oksanen, Markku, "The Moral Value of Biodiversity," Ambio (Royal Swedish Academy of Sciences) 26(no. 8, Dec. 1997):541-545. How the preservation of biodiversity is morally justified in some of the key texts on environmental ethics. Whether or not biodiversity can be justified as a moral end in itself. Views are classified according to the criteria which they hold to be the ultimate moral beneficiaries; positions are named as anthropocentrism, biocentrism and ecocentrism. In general, they are not in favor of regarding biodiversity as intrinsically valuable, but think its moral value is derivative. This means that the myriad characters of life on Earth are to be maintained as diverse because of their instrumental value for the constituents. It seems that Naess's deep ecology is the only major position that argues for biodiversity's intrinsic value, but this view has proved to be problematic. Oksanen is completing a Ph.D. in environmental ethics and property rights at the University of Turku, Turku, Finland. (v9,#1)

Oksanen, Markku, and Juhani Pietarinen, eds., Philosophy and Biodiversity. Cambridge: Cambridge University Press, 2004. The nature and importance of biodiversity. What is worthy of protection or restoration and what is the acceptable level of costs? Is it permissible to kill sentient animals to promote native populations? Can species be reintroduced if they have disappeared a long time ago? How should the responsibilities for biodiversity be shared. OLaughlin (O'Laughlin), Jay, James G. MacCracken, David L. Adams, Stephen C. Bunting, Keith A. Blatner, and Charles E. Kegan, III, Forest Health Conditions in Idaho. Moscow, ID: University of Idaho, College of Forestry, Idaho Forest, Wildlife and Range Policy Analysis Group, Report No. 11, December 1993. (Phone 208/885-5776, FAX 208/885-6226) 244 pages. An executive summary is available, 37 pages. If forest health is a statement about trees at risk of mortality from insects, disease, and wildfire, then much of Idaho's forest land is either unhealthy or on the verge of poor health, especially in the national forests that represent two-thirds of the state's timberlands. Firs are the most prevalent trees in Idaho's forests, which were predominantly pines before European settlers arrived in Idaho. Firs are less resistant than pines to many insects and diseases as well as wildfire. Prolonged drought in southern Idaho has weakened forests, making them even more susceptible to insect epidemics and wildfires. In northern Idaho, root diseases are affecting the growth potential of mature stands. In forests throughout the state, environmental, ecological, economic, and social values are at risk. The situation can be changed by using forest management practices favoring pines instead of firs and reducing competition between trees by thinning, while protecting other forest values. Two obstacles to this course of action are public policy and public trust.

The report is philosophically interesting for its discussion of forest health, and reveals many limitations of this metaphor as applied to forests. A tree (like a person) is not healthy when it dies, but is a forest unhealthy when its trees age and die? Or burn? Or are beset with insect blights? The renewal and regenerative processes in a forest system have no clear analogue in bodily health. The report concludes that forest health is significantly a cultural construction. O'Laughlin is Director of the Policy Analysis Group, and teaches natural resource policy at the University of Idaho. (v5,#4)

Oliver, Harold H., "The Neglect and Recovery of Nature in Twentieth-Century Protestant Thought," Journal of the American Academy of Religion 60 (no. 3, 1992):379-404. Protestants neglected a long heritage of theology of nature and, in the first part of the twentieth century "'nature' became the ward of science and technology, with little interference--and less wisdom--from the Church." The Protestant theological giants, Barth, Brunner, and Bultmann, willfully rejected a theology of nature, though Tillich sought to be more inclusive. The theologians overvalued world history and devalued nature. The ecological crisis has had an awakening effect, especially when blame for the ecological crisis was laid at the door of Christianity itself. More recent proposals for an integral theology have the criteria of wholeness, mutuality, responsiveness, and mystery. Oliver is professor of philosophical theology at Boston University School of Theology. (v4,#2)

Oliveri, Paula, and Eric H. Davidson. "Built to Run, Not Fail." *Science* Vol. 315, no. 5818 (16 March 2007): 1510-11. Networks of genes that control organism development are highly conserved across processes and species. There is often "overlayered" circuit engineering, with multiple fail-safe and backup circuits. "We may interpret this as we like as over-engineering; or as design deluxe, replete with bells and whistles; or as the expected result of an evolutionary process in which individual regulatory modules have been added in and overlain at different times." So it turns out that organisms are well designed after all, only this design is produced by the grim pressures of natural selection. The authors are in biology at California Institute of Technology, Pasadena.

Olsen, Florence, "Bellesiles Resigns from Emory after University Report Questions his Research for Book on Guns," Chronicle of Higher Education, Daily News (daily on line edition), October 28, 2002 (<http://chronicle.com>). Bellesiles misfired and fired. Michael A. Bellesiles published Arming America: The Origins of a National Gun Culture (New York: Alfred A. Knopf, 2000) (ISEE Newsletter v. 12,#2) claiming that gun ownership in early America was not as widespread as believed and largely a myth cultivated by the gun industry. The book won the Bancroft Prize and was praised in The New York Review of Books and The New York Times Book Review. But prominent historians have been challenging Bellesiles' scholarship since, for example in a forum in The William and Mary Quarterly in February 2002. Emory University, where he teaches, convened an independent investigative report, which found it difficult to verify his archival records either "because the source does not exist, because the citation is inaccurate, or because the citation, though correct, refers to a source that has been misplaced." One commentator said that among scholars of early American history, Bellesiles' book was widely considered to be "marred by unusually careless and disorganized scholarship." Under pressure, Bellesiles has resigned from Emory University, though he says the charges are unfair and that he will correct errors in a second edition.

Olson, Robert, and David Rejeski, eds. *Environmentalism and the Technologies of Tomorrow: Shaping the Next Industrial Revolution*. Washington, DC: Island Press, 2005. This anthology consists of seventeen essays that attempt to answer the question "what's next?" in technology and environmental studies. Essays are grouped into three sub-themes of the transition to sustainability, new technologies, and new governance. The authors are from academic institutions, government, and business, and the anthology stems from an agreement between the Environmental Protection Agency and the Woodrow Wilson International Center of Scholars.

Olsson, Anna S., Christian Gamborg and Peter Sandhoe, "Taking Ethics into Account in Farm Animal Breeding: What Can the Breeding Companies Achieve?" Journal of Agricultural and Environmental Ethics 19(2006):37-46. Animal welfare and the ethical issues it raises have been discussed for a couple of decades. The emphasis has been on the direct effects of housing and husbandry, but more attention is now being given to problems originating in selective breeding. European attempts to adjust animal welfare legislation to deal with these problems have been largely unsuccessful, but the fact that selective breeding can introduce welfare problems continues to place an ethical responsibility on the animal breeding industry. This is likely to be embedded in an international agreement. some kind of ethical code. Results from recent projects involving commercial breeding enterprises are presented. The authors are with the Institute for Molecular and Cell Biology, Porto, Portugal. (JAEE)

ONeil (O'Neil), Rick. "Intrinsic Value, Moral Standing, and Species." Environmental Ethics 19(1997):45-52. Environmental philosophers often conflate the concepts of intrinsic value and moral standing. As a result, individualists needlessly deny intrinsic value to species, while holists falsely attribute moral standing to species. Conceived either as classes or as historical individuals, at least some species possess intrinsic value. Nevertheless, even if a species has interests or a good of its own, it cannot have moral standing because species lack sentience. Although there is a basis for duties toward some species (in terms of their intrinsic value), it is not the one that the holists claim. O'Neil is in philosophy at Transylvania University, Lexington, KY. (EE)

ONeil (O'Neil), Rick. "Animal Liberation versus Environmentalism: The Care Solution." Environmental Ethics 22(2000):183-190. Animal liberationism and environmentalism generally are considered incompatible positions. But, properly conceived, they simply provide answers to different questions, concerning moral standing and intrinsic value, respectively. The two views together constitute an environmental ethic that combines environmental justice and environmental care. I show that this approach is not only consistent but defensible. (EE)

ONEill (O'Neill), John, "Wilderness, cultivation and appropriation," Philosophy and Geography 5 (No. 1, 2002): 35-50. 'Nature' and 'wilderness' are central normative categories of environmentalism. Appeal to those categories has been subject to two lines of criticism: from constructivists who deny there is something called 'nature' to be defended; from the environmental justice movement who point to the role of appeals to 'nature' and 'wilderness' in the appropriation of land of socially marginal populations. While these arguments often come together they are independent. This paper develops the second line of argument by placing recent appeals to 'wilderness' in the context of historical uses of the concept to justify the appropriation of land. However, it argues that the constructivist line is less defensible. The paper finishes by placing the debates around wilderness in the context of more general tensions between philosophical perspectives on the environment and the particular cultural perspectives of disciplines like anthropology, in particular the prima facie conflict between the aspirations of many philosophers for thin and cosmopolitan moral language that transcends local culture, and the aspirations of disciplines like anthropology to uncover a thick moral vocabulary that is local to particular cultures. O'Neill is Professor of Philosophy at Lancaster University. (P&G)

ONeill (O'Neill), Onora, "Environmental Values, Anthropocentrism and Speciesism," Environmental Values 6(1997):127-142. ABSTRACT: Ethical reasoning of all types is anthropocentric, in that it is addressed to agents, but anthropocentric starting points vary in the preference they accord the human species. Realist claims about environmental values, utilitarian reasoning and rights-based reasoning all have difficulties in according ethical concern to certain aspects of the natural world. Obligation-based reasoning can provide quite strong if incomplete reasons to protect the natural world, including individual non-human animals. Although it cannot establish all the conclusions to which anti-speciesists aspire, it may establish many of them with some clarity. Newnham College, Cambridge CB3 9DF, UK. (EV)

ONeill (O'Neill), John. "Humanism and Nature." Radical Philosophy 66 (Spring 1994): 21-30. Those who aim to construct links between Marxism and the green movement often link to Marx's early work on alienation as a source for a green Marxism. There is an immediate apparent problem with any such attempt to marry the early Marx and the greens, viz. that Marx's early works are humanist. Doesn't humanism necessarily entail that only humans, their states and achievements, have value? And isn't this immediately incompatible with modern green thought which allows that non-humans, their states and achievements, also have intrinsic value? This argument as it stands is too hasty. The term "humanism" is an ambiguous one and it need not immediately entail that only the states and achievements of humans have value. Humanism can have other meanings. O'Neill is in philosophy, University of Lancaster. (v6,#1)

ONeill (O'Neill), John, Clive L. Spash. Appendix: "Policy Research Brief Conceptions of Value in Environmental Decision-Making." Environmental Values 9(2000):521-536. Abstract: Environmental problems have an ethical dimension. They are not just about the efficient use of resources. Justice in the distribution of environmental goods and burdens, fairness in the processes of environmental decision-making, the moral claims of future generations and non-humans, these and other ethical values inform the responses of citizens to environmental problems. How can these concerns enter into good policy-making processes? Two expert-based approaches are commonly advocated for incorporating ethical values into environmental decision-making. One is an 'economic capture' approach, according to which existing economic methods can be successfully extended to include ethical concerns. For example, stated preference methods, especially contingent valuation, have been developed to try and capture ethical responses as 'non-use values' of the environment, in particular 'existence values'. The other is a 'moral expert' approach which confines economic methods to the analysis of welfare gains, and assumes committees of ethical experts will complement economic expertise. Both approaches face problems in terms of addressing many widely held ethical values about the environment. Furthermore, both face problems concerning the democratic legitimacy of their procedures. How can policy-making be made responsive to different ethical values? What role is there for new deliberative and participatory methods? How far do existing decision-making institutions have the capacities to incorporate different modes of articulating environmental values? This policy brief examines the limitations of current attempts to capture ethical values within existing economic instruments and considers how these limitations might be overcome. Section 1 examines the assumptions that standard economic theory makes about individuals when they express values and make choices about the environment. The current models of agents that inform policy-making are seen to be ill-suited to incorporating the ethical responses of agents and this reveals some of the policy failures that may result. Section 2 shows how the physical and social properties of many environmental goods prevent their being treated as commodities. Section 3 considers the problems surrounding conceptions of fairness and legitimacy in processes for environmental valuation. Section 4 raises questions concerning the capacities of policy-making institutions to take cognisance of the results of different methods for articulating environmental values. (EV)

ONeill (O'Neill), John, "Environmental Virtues and Public Policy," Philosophy in the Contemporary World 8 (Number 2, Fall-Winter 2001):125-136. The Aristotelian view that public institutions should aim at the good life is sometimes criticized on the grounds that it makes for an authoritarian politics that is incompatible with the pluralism of modern society. The criticism seems to have particular power against modern environmentalism, that it offers a local vision of the good life which fails to appreciate the variety of possible human relationships to the natural environment, and so, as a guide to public policy, it leads to green authoritarianism. This paper argues to the contrary that an Aristotelian position which defends environmental goods as constitutive of the good life is consistent with recognition of the plurality of ways our relations to the natural world can be lived. It is compatible with the recognition of distinct cultural expressions of such relations and of the special place particular histories of individuals and social groups have in constraining environmental policy. Orenstein, Gloria Feman, "The greening of Gaia: Ecofeminist artists revisit the garden," Ethics and the Environment 8(no. 1, 2003):103-111. Ecofeminism is a different kind of political movement, for instead of viewing the arts as adjuncts to political activity or as distractions from political activism, ecofeminism considers the arts to be essential catalysts of change. In the eighties and early nineties, ecofeminist artists

often invoked the symbol of The Great Mother, The Goddess, or Gaia in order to emphasize the interconnectedness of three levels of creation, all imaged as female outside of patriarchal civilization: cosmic creation, procreation, and artistic creation. Ecofeminists today feel less of a need to examine the past. It is more urgent for them to concentrate on the work that needs to be done to regenerate the earth today. Orenstein is in comparative literature and gender studies, University of Southern California. (E&E)

Oreskes, Naomi, "The Scientific Consensus on Climate Change," Science 306(3 December 2004):1686. "Policy-makers and the media, particularly in the United States, frequently assert that climate science is highly uncertain. Some have used this as an argument against adopting strong measures to reduce greenhouse gas emissions. ... Such statements suggest that there might be substantive disagreement in the scientific community about the reality of anthropogenic climate change. This is not the case." All the major study groups concur that the present warming trends are human-caused. In a review of 928 papers, 75% either explicitly or implicitly endorsed the consensus view, 25% took no position. Not one paper disagreed with the consensus position. Oreskes is in the Department of History and Science Studies Program, University of California, San Diego.

Oreskes, Naomi, Kristin Shrader-Frechette, and Kenneth Belitz, "Verification, Validation, and Confirmation of Numerical Models in the Earth Sciences," Science 263(February 4, 1994):641-646. Verification and validation of numerical models of natural systems is impossible. This is because natural systems are never closed and because model results are always nonunique. Models can be confirmed by the demonstration of agreement between observation and prediction, but confirmation is inherently partial. Complete confirmation is logically precluded by the fallacy of affirming the consequent and by incomplete access to natural phenomena. Models can only be evaluated in relative terms, and their predictive value is always open to question. The primary value of models is heuristic. Oreskes and Belitz are in earth science at Dartmouth College, Shrader-Frechette is in philosophy at the University of South Florida. (v5,#1)

ORiordan (O'Riordan), Timothy, and Andrew Jordan. "The Precautionary Principle in Contemporary Environmental Politics." Environmental Values 4(1995):191-212. In its restless metamorphosis, the environmental movement captures ideas and transforms them into principles, guidelines and points of leverage. Sustainability is one such idea, now being reinterpreted in the aftermath of the 1992 Rio Conference. So too is the precautionary principle. Like sustainability, the precautionary principle is neither a well defined principle nor a stable concept. It has become the repository for a jumble of adventurous beliefs that challenge the status quo of political power, ideology and civil rights. Neither concept has much coherence other than it is captured by the spirit that is challenging the authority of science, the hegemony of cost-benefit analysis, the powerlessness of victims of environmental abuse, and the unimplemented ethics of intrinsic natural rights and inter-generational equity. It is because the mood

of the times needs an organising idea that the precautionary principle is getting a fair wind. However, unless its advocates sharpen up their understanding of the term, the precautionary principle may not establish the influence it deserves. Its future looks promising but it is not assured. O'Riordan (O'Riordan), Tim and James Cameron, eds., Interpreting the Precautionary Principle. London: Cameron May, Ltd., 1994. The precautionary principle, especially applicable in environmental issues, states that public and private interests should act so as to prevent harm, even where there is no scientific proof that an activity does cause damage to the environment. This has serious implications for risk evaluation and assessment. Sample article: Robin Attfield, "The Precautionary Principle and Moral Values."

O'Riordan (O'Riordan), Tim, "Valuation as Revelation and Reconciliation," Environmental Values 6(1997):169-184. ABSTRACT: Valuation is portrayed here as a dynamic and interactive process, not a static notion linked to willingness to pay. Valuation through economic measures can be built upon by creating trusting and legitimising procedures of stakeholder negotiation and mediation. This is a familiar practice in the US, but it is only beginning to be recognised as an environmental management tool in the UK. The introduction of strategic environmental and landuse appraisal plans for shorelines, estuaries, river catchments and rural landscapes, combined with the mobilisation of protest around landuse proposals that are not seemingly justified on the basis of need (incinerators, landfills, quarries, reservoirs, roads) suggest that a more legitimate participatory form of democracy is required to reveal valuation through consensual negotiation. Where learning about conservation takes place, also teaches about conservation. One criteria is that beauty here must cause no ugliness somewhere else or at some later time. The experience of Oberlin College, where Orr teaches. (v8,#2)

Orr, David W., "The Liberal Arts, the Campus, and the Biosphere," Harvard Educational Review 60 (1990): 205-16. Where does the campus fit into the biosphere? What role should universities play in the struggle to save the environment? Although critics, such as Allan Bloom, have recently accused liberal arts institutions of failing to educate college youth properly, few have addressed the question of how colleges and universities might make students more aware and responsible about their place in the natural world. Orr offers a rationale for incorporating environmental concerns into the curriculum of higher education and suggests examples of curricular innovations, including programs for restructuring the ways colleges procure food, deal with waste, and use energy. A focus on the ecosystem of the college campus can broaden students' visions of the natural world in which they live. Orr teaches environmental studies at Oberlin College. (v6,#2)

Judson Kenworthy, Frederick T. Short, and Michelle Waycott. "A Global Crisis for Seagrass Ecosystems." *BioScience* Vol. 56, no. 12 (2006): 987-96. Seagrasses, marine flowering plants, have a long evolutionary history but are now challenged with rapid environmental changes as a result of coastal human population pressures. Seagrasses provide key ecological services, including organic carbon production and export, nutrient cycling, sediment stabilization, enhanced biodiversity, and trophic transfers to adjacent habitats in tropical and temperate regions. They also serve as "coastal canaries," global biological sentinels of increasing anthropogenic influences in coastal ecosystems, with large-scale losses reported worldwide. Multiple stressors, including sediment and nutrient runoff, physical disturbance, invasive species, disease, commercial fishing practices, aquaculture, overgrazing, algal blooms, and global warming, cause seagrass declines at scales of square meters to hundreds of square kilometers. Reported seagrass losses have led to increased awareness of the need for seagrass protection, monitoring, management, and restoration. However, seagrass science, which has rapidly grown, is disconnected from public awareness of seagrasses, which has lagged behind awareness of other coastal ecosystems. There is a critical need for a targeted global conservation effort that includes a reduction of watershed nutrient and sediment inputs to seagrass habitats and a targeted educational program informing regulators and the public of the value of seagrass meadows.

Ortiz, Sara Elizabeth Gavrell, "Beyond Welfare: Animal Integrity, Animal Dignity, and Genetic Engineering," *Ethics and the Environment* 9(no. 1, 2004):94-120. Bernard Rollin argues that it is permissible to change an animal's telos through genetic engineering, if it doesn't harm the animal's welfare. Recent attempts to undermine his argument rely either on the claim that diminishing certain capacities always harms an animal's welfare or on the claim that it always violates an animal's integrity. I argue that these fail. However, respect for animal dignity provides a defeasible reason not to engineer an animal in a way that inhibits the development of those functions that a member of its species can normally perform, even if the modification would improve the animal's welfare. Ortiz is a Ph.D. candidate at the University of Wisconsin, Madison. (E&E)

Orts, Eric W., "A Reflexive Model of Environmental Regulation," Business Ethics Quarterly 5(1995):779-794. We should begin to consider a new model of reflexive environmental law. This regulatory strategy aims to provide more reflective as well as more efficient environmental regulation.

Orts, Eric W., "Reflexive Environmental Law," Northwestern University Law Review 89(1995):1227-1340. Most environmental law is regulation, command and control of business by outside law, imposed by political authorities. A better approach is reflexive environmental law, where businesses from within adopt systematic ways of thinking and operating in an environmentally responsible manner. This creates a climate in which businesses voluntarily adopt procedures to encourage environmentally sound decision making and to monitor environmental progress. Long article with much detail and nearly 500 legal-style footnotes. Orts is in law, The Wharton School, University of Pennsylvania. (v.10,#2)

Orts, Eric W., and Strudler, Alan, "The Ethical and Environmental Limits of Stakeholder Theory," Business Ethics Quarterly 12 (no. 2, 2002):215-233. We argue that though stakeholder theory has much to recommend it, particularly as a heuristic for thinking about business firms properly as involving the economic interests of other groups beyond those of the shareholders or other equity owners, the theory is limited by its focus on the interests of human participants in business enterprise. Stakeholder theory runs into intractable philosophical difficulty in providing credible ethical principles for business managers in dealing with some topics, such as the natural environment that do not directly involve human beings within a business firm or who engage in transactions with a firm. Corporate decision-making must include an appreciation of these ethical values even though they cannot be captured in stakeholder theory. Orts is in law, The Wharton School, University of Pennsylvania. (v.13, #3)

Orts, Eric W., and Alan Strudler, "The Ethical and Environmental Limits of Stakeholder Theory," Business Ethics Quarterly 12(no. 2, 2002):215-233. Stakeholder theory has much to recommend it, but is limited to human participants in the business enterprise. It runs into intractable problems in providing credible ethical principles for business managers dealing with the natural environment. Orts and Strudler are at Wharton School, Environmental Management Program, University of Pennsylvania, Philadelphia.

Ott, Konrad, "Eine Theorie 'starker' Nachhaltigkeit. (A theory of 'strong' sustainability)" In German. Natur und Kultur 2(no. 1, 2001):55-75. Abstract: This article outlines a theoretical approach towards sustainability. Such approach should be ethically reflective, normatively sound and conceptually clear-cut. Any theory of sustainability must encompass a reasonable choice between the two competing concepts of 'weak' and 'strong' sustainability. It will be argued that strong sustainability should be favored. Some policy implications of this choice will be outlined. (v.12,#2)

Ott, Konrad, Ökologie und Ethik: Ein Versuch praktischer Philosophie (Ecology and Ethics: An Attempt at Practical Philosophy). Tübingen: Attempto Verlag, 1993. 188 pages. DM 38,--. ISBN 3-89308-162-3. Ott's book has three main parts: 1. The Concept of Ecology. 2. Critical Theory and Nature. 3. Ecoethical Arguments. In part one, he discusses the history of the discipline of philosophy and various ecological approaches to environmental philosophy, such as human ecology, speculative ecology, including Schorsch's mystical holism, Roszak's subversive ecology,, Hösle's objective idealism, and Christian ecology. In part two, he finds that we can learn from Adorno's and Horkheimer's views on nature, the early Habermas' view in Knowledge and Human Interests, and the later Habermas' view in his discourse ethical writings. Part three presents a taxonomy of ecoethical arguments: a) utilitarianism, b) aestheticism, c) the human right to nature, d) ethics of compassion and ecological pathognomics, e) objective and subjective theories of value in nature, and f) evolutionism. Ott is widely read and draws on both German and English sources. He himself opts for a teleologically grounded physiocentric position, which he calls "ecological pathognomics" (p. 144, pp. 153-155). He believes that we should further the good of teleological nature for its own sake. Ott did his dissertation with Habermas in Frankfurt and is about to finish his habilitation (teaching qualification) in Tübingen. (Thanks to Angelika Krebs, University of Frankfurt.)

Ouderkirk, Wayne. "Can Nature be Evil? Rolston, Disvalue, and Theodicy." Environmental Ethics 21(1999):135-150. Holmes Rolston, III's analysis of disvalue in nature is the sole explicit and sustained discussion of the negative side of nature by an environmental philosopher. Given Rolston's theological background, perhaps it is not surprising that his analysis has strong analogues with traditional theodicies, which attempt to account for evil in a world created by a good God. In this paper, I explore those analogues and use them to help evaluate Rolston's account. Ultimately, I find it more satisfactory than traditional theodicy in its own context, but I also raise two problems: a weighting and a counseling problem. First, once Rolston acknowledges the reality and role of disvalue in nature, he discounts its significance too greatly. Second, his account is less useful in helping those who have been harmed by the destructive activity of nature. I claim that we can usefully regard Rolston's analysis as a deconstruction of the anthropocentric, non-ecological view of nature. Finally, I argue that the two problems and a related issue, the objectivity/subjectivity of values, point in the direction of a pragmatist account of value in nature. (EE)

Oudshoorn, Frank W., Reint Jan Renes and Imke J. M. De Boer. "Systems In Organic Dairy Production," Journal of Agricultural and Environmental Ethics 21(2008):205-228. The aim of this study was to explore stakeholder perceptions of the contribution of an Automatic Milking System (AMS) to

sustainable development of organic dairy production in Denmark and the Netherlands. In addition, reasons for the current difference in AMS use on organic dairy farms between both countries were explored. To answer above mentioned aims, farmers and advisors in both countries were interviewed using a focus group approach. Questions of the interviews were based on a literature review on sustainability issues affected by introduction of AMS. Participants expressed no moral problems regarding AMS use. They, however, pointed out uncertainty about the economic gain, difficulties with grazing, adaptation problems to technology, and image problems towards consumers. The latter results from a reduction in grazing time affecting both animal welfare and product quality. The participants did not recognize eutrophication, as result of high stocking density on farmstead lots, as a problem caused by AMS. The milk quality problem related to AMS use, although acknowledged as crucial towards consumers, was not prioritized very highly, especially not by the farmers in both countries. All groups were, however, unanimous in their perception of how important image was as far as the consumers are concerned. The perception analysis revealed that Dutch participants were more concerned about the economic payoff of AMS use, and showed more reluctance towards enlargement than Danish ones. In addition, they acknowledged the small-scale naturalness of organic production. These differences in perception could possibly explain observed differences in AMS use in organic dairy production between Denmark and the Netherlands. The authors are in the Department of Agricultural Engineering, University of Aarhus, Research Centre Bygholm, Denmark.

Oughton, Deborah, "Protection of the Environment from Ionising Radiation: Ethical Issues," Journal of Environmental Radioactivity 66(2003):3-18. Some main ethical issues concerning the protection of the environment from radiation. Issues of harm and monetary valuation. Difficulties with scientific uncertainty and applications of the precautionary principle. Issues concerned with the distribution of risk and its relevance for participation in decision-making. There are strong ethical grounds to provide for the protection of the environment and, all other things being equal, there is no reason to treat ionising radiation differently from other environmental stressors. Well-grounded in ethical theory. Oughton is in chemistry and biotechnology, Agricultural University of Norway, Aas.

Overall, Christine, "Public Toilets: Sex Segregation Revisited," *Ethics and the Environment* 12(no. 2, 2007):71-92. Public toilets are a key part of the urban environment. This paper examines and evaluates the pervasive sex segregation, throughout North America, of public toilets. The issue is situated within a larger contextthe design and management of the urban environment; larger assumptions about sexuality, reproduction, and privacy that govern that environment; and continuing compulsory sex identification and segregation which still define key areas of "public" space. I examine seven groups of arguments in favor of sex segregation, arguing that all of them are inadequate. I then present reasons showing why ending the

sex segregation of public toilets is justified. Overall is in philosophy, Queen's University, Kingston, Ontario.

Oxford Declaration on Global Warming. Climate scientists and Christian leaders call for action. Some 70 climate scientists, policy-makers, and Christian leaders from six continents gathered for "Climate Forum 2002" in Oxford, England, St. Anne's College, to address the growing crisis of human-induced

climate change. The Forum recognized the reality and urgency of the problem, which particularly affects the world's poorest peoples and the very fabric of the biosphere. The Forum also recognized that the Christian community has a special obligation to provide moral leadership and an example of caring service to people and to all God's Creation. The Forum produced a statement declaring how human-induced climate change is an ethical and a religious problem. The Forum was sponsored by the John Ray Initiative (U.K.) and the AuSable Institute of Environmental Studies (U.S.). Website: <http://climateforum2002.org>

Ozkaynak (Özkaynak), Begüm, Pat Devine and Dan Rigby, "Operationalising Strong Sustainability: Definitions, Methodologies and Outcomes," *Environmental Values* 13(2004):279-303. While acknowledging the absence of a single definition or theory of sustainability, this paper argues that a discussion of sustainability which refers only to definitions is pointless without an understanding of how the definitions are operationalised. In this context, the paper considers the operationalisation of strong sustainability.

The definitions and operationalisation of strong sustainability most closely associated with (i) neoclassical environmental economics and (ii) ecological economics are discussed and compared. This analysis raises questions about the extent to which ecological economics has been able to influence real-world decisions and policy. The paper ends by considering whether the economic and political power structure taken as given by ecological economics is compatible with its policy perspective. Özkaynak is at the Universitat Autònoma de Barcelona. Devine and Rigby are in economics, University of Manchester, UK. (EV)

Pacala, S. W., et al., "False Alarm over Environmental False Alarms," *Science* 301(28 August 2003):1187-1188. In face of uncertainty, many, even most of the environmental alarms may be false, or overestimated. But many of the alarms will be correct, often underestimated; and resulting mitigation, if it takes place, will bring considerable benefits. Critics have been saying that we have too many false alarms. But, these authors conclude, "The balance of the evidence indicates that we are receiving substantial benefits from our response to environmental alarms. These benefits range from aesthetic (such as our joy at the bald eagle's recovery) to the savings of millions of lives (for example, regulation of air and water pollutants). Still, the critical quality determining whether there are too many false environmental alarms is the marginal benefit of the alarms." On balance, they find that "given the potential to save millions of lives, this is no time to turn down the sensitivity of our environmental alarms." Pacala is in ecology and evolutionary biology, Princeton University. (v 14, #3)

Pace, Norman R., "A Molecular View of Microbial Diversity and the Biosphere," *Science* 276(1997):734-740. "Microbial organisms occupy a peculiar place in the human view of life. Microbes receive little attention in our general texts of biology. They are largely ignored by most professional biologists and are virtually unknown to the public except in the contexts of disease and rot. Yet, the workings of the biosphere depend absolutely on the activities of the microbial world. Our texts articulate biodiversity in

terms of large organisms: insects usually top the count of species. Yet, if we squeeze out any one of these insects and examine its contents under the microscope, we find hundreds of thousands of distinct microbial species. A handful of soil contains billions of microbial organisms, so many different types that accurate numbers remain unknown. We know so little about microbial biology, despite it being a part of biology that looms so large in the sustenance of the planet." "Members of some of these lineages are only distantly related to known organisms but are sufficiently abundant that they are likely to have an impact on the chemistry of the biosphere." One interesting development: There now appears to be a flourishing subterranean life, a biological world not based on photosynthesis; some even speculate that most of the biomass on Earth is subterranean. Pace is in microbial biology at the University of California, Berkeley. See also Richard A. Kerr entry. (v8,#2)

Paden, Roger, "The two professions of Hippodamus of Miletus," Philosophy and Geography 4 (No. 1, 2001): 25-48. According to Aristotle, both urban planning and political philosophy originated in the work of one man, Hippodamus of Miletus. If Aristotle is right, then the study of Hippodamus's work should help us understand their history as interrelated fields. Unfortunately, it is difficult to determine with any degree of precision exactly what Hippodamus's contributions were to these two fields when the two fields are studied separately. In urban planning, Hippodamus was traditionally credited with having invented the "grid pattern" in which straight streets intersect each other at right angles to form regular city blocks. However, as grid patterned cities have been discovered that were built before Hippodamus' birth, this traditional attribution must be false. In political philosophy, Hippodamus was credited with having written the first utopian "constitution". However, Aristotle's account of this constitution is so brief that it is difficult to determine what philosophical position lies behind it and, as that account makes clear, several of the laws governing Hippodamus's ideal city seem contradictory. In this paper, I argue that Hippodamus did significant work in both fields but that his intentions can only be seen clearly if his philosophical and architectural works are read together. This reading not only makes clear the unique contribution that Hippodamus made to both disciplines, but it shows how they were –and perhaps how they should be –related. Paden is Associate Professor of Philosophy in the Department of Philosophy and Religious Studies at George Mason University. (P&G)

Paden, Roger, "Against Grand Theory in Environmental Ethics." Environmental Values 3(1994):61-70. Environmental ethics has been strongly influenced by biological ideas. This essay traces a number of these influences. Unfortunately, environmental ethicists have tended to produce moral theories on a grand scale. This tendency is criticized. It is argued that environmental ethicists should allow the ecological conception of the complexity of biological communities to influence their conception of the moral community. If this were to happen, it is argued, they would have to turn away from grand theories to 'theories of the middle range' while adopting a more 'empirical' approach to moral philosophy. KEYWORDS: Moral community, moral considerability, evolution, environment, ecology, grand theories. Paden is in philosophy and religious studies at George Mason University, Va. (EV)

Paden, Roger. "Urban Planning and Multiple Preference Schedules: On R.M. Hare's 'Contrasting Methods in Environmental Planning'". Environmental Values 8(1999):55-73. ABSTRACT: This essay presents a critical analysis of Hare's article "Contrasting Methods in Environmental Planning". It argues that Hare has drawn an important distinction between two "methods" used in both urban and environmental planning, and that Hare is correct in the conclusion of his argument that one of these methods, "the trial-design method", is superior to the other, "the means-end method". However, this paper presents a new argument in support of that conclusion. This new argument is important for two reasons. First, it points to the existence of at least two different kinds of preference schedule. Second, it supports a type of decision making procedure to be used in "multiple-client situations" different from the one envisioned by Hare. This procedure, oddly enough, resembles the procedures outlined by both Habermas and Rawls. However, it can be defended on recognisably utilitarian grounds. KEYWORDS: Hare, Rawls, Habermas, urban planning, design, preference schedules, utilitarianism. Paden, Roger. "Nature and Morality." Environmental Ethics 14(1992):239-51. In their attempt to develop a nonanthropocentric ethic, many biocentric philosophers have been content to argue for the expansion of the moral community to include natural entities. In doing so, they have implicitly accepted the idea that the conceptions of moral duties developed by anthropocentric philosophers to describe the moral relationships that hold between humans can be directly applied to the human/nature relationship. To make this expansion plausible, they have had to argue that natural entities have traits that are similar to the morally relevant traits of human beings, e.g., interests, the capacity to experience pleasure and pain, or "purpose." Not only are these arguments often unconvincing, but it seems implausible that the same moral concepts and principles that govern human relationships also should govern human/nonhuman relationships. Many nonanthropocentric ethics, I argue, are (mistakenly) anthropomorphic. They anthropomorphize nature and they anthropomorphize our relationship with nature. To go beyond this relationship I recommend the development of a nonanthropomorphic biocentric ethic. Such an ethic requires us to understand better what nature is and what role nature plays in moral experience and action. In such an ethic, I argue, nature is viewed as a transcendent "thing" with a transcendental moral significance. Paden is in Philosophy and Religious Studies, George Mason, University, Fairfax, VA. Padilla, Emilio, "Climate Change, Economic Analysis and Sustainable Development," Environmental Values 13(2004):523-544. This paper discusses the limitations, omissions and value judgements of the application of conventional economic analysis in the evaluation of climate change mitigation policies. It is argued that these have biased the result of the assessment models towards the recommendation of less aggressive mitigation strategies. Consequently, this paper questions whether they provide appropriate policy recommendations. The unequal distribution of rights implicitly assumed in conventional economic analyses applied to climate change is questioned and an alternative approach considering a distribution of rights consistent with sustainable development is put forward. Finally, the points that an analysis consistent with sustainable development should take into account are presented. Padilla is in Applied Economics, Universitat Autònoma de Bellaterra, Bellaterra, Spain. (EV)

Paehlke, Robert C., Environmentalism and the Future of Progressive Politics. New Haven: Yale University Press, 1989. Pp. 325. This is a book about political theory and public policy, about environmentalism as a new wide-ranging political ideology, comparable to the classical political ideologies of liberalism, conservatism, and socialism. Paehlke's basic argument is that the values which underlie an environmental world-view have implications for public policy that transcend standard "environmental" issues. Environmentalism can thus serve as the basis of a new ideology in progressive

politics. The book offers a good overview of the development of a politically aware environmental consciousness through the issues of pollution, population, and the energy crisis, and the necessary connection of environmental thought to environmental science. The ideology of environmentalism is also contrasted with the traditional ideologies of liberalism, conservatism, and socialism. (Katz, Bibl # 2)

Paehlke, Robert. "Democracy, Bureaucracy, and Environmentalism." Environmental Ethics 10(1988):291-308. Several prominent analysts, including Heilbroner, Ophuls, and Passmore, have drawn bleak conclusions regarding the implications of contemporary environmental realities for the future of democracy. I establish, however, that the day-to-day practice of environmental politics has often had an opposite effect: democratic processes have been enhanced. I conclude that the resolution of environmental problems may well be more promising within a political context which is more rather than less democratic. Paehlke is in Political Studies/ Environmental and Resource Studies Trent University, Ontario, Canada. (EE)

Page, Ruth, God and the Web of Creation. London: SCM Press, 1996. 188 pages. Unexamined anthropocentrism is a bad thing, even though some measure of human centeredness is inescapable among humans. But the Biblical concept of nature is not straightforward. The Bible is too varied in what it says on creation, and in many places too far removed from what is taken for granted in contemporary science and society, for there to be a "biblical" doctrine of creation which does not exercise selectivity and the fudging of issues. Page argues that what God created was possibility, with creatures free to use it as they could. All creation is by its very being a response to the divine gift of possibility. God does not so much "make" or "design" creation as give the possibility of letting the creatures make themselves, and this allows for the contingent better and worse uses of these possibilities by creation as it comes into being,

flourishes, and dies. Page portrays what she calls a "companioned world" (pp. 81ff). "The picture involved in this doctrine of creation is not one of God setting up the initial conditions with the express design to produce complexity and human consciousness and intelligence, but rather one of God letting be whatever would and could emerge from that freedom, and enjoying all responses of all kinds, with their various qualities, of which intelligence is only one" (p. 80). Page teaches systematic theology at New College, University of Edinburgh, and is the first woman Principal of that College.

Palamar, Colette R. "Wild, Women, and Wolves: An Ecological Feminist Examination of Wolf Reintroduction." Environmental Ethics 29(2007):63-75. Despite the successes, and the considerable and continuing ethical disputes regarding wolf reintroduction in the United States, no clear, cogent, theoretically based ethical examination of the wolf reintroductions has yet been completed. Ecological feminist thought, particularly as articulated by Karen J. Warren, presents one way to create such an ethical assessment. Applying ecological feminist theories to wolf reintroduction also generates an intriguing instance of theoretical application in the "real world" and sheds insight on the pragmatic value of ecological feminist thought. While ecofeminism does not give a definitive and decisively defensible position concerning wolf reintroduction, it does offer a repeatable framework and set of conditions by

which one can assess environmental practice and policy, evidencing yet another example of the relevance of environmental ethics for the assessment of environmental policy. (EE)

Palamar, Colette R. "Restorashyn: Ecofeminist Restoration." Environmental Ethics 28(2006):285-301. Most restoration projects are designed to approximate the species composition and ecotypes ecologists and historians determine were present in an area at some point in the historical past. In most cases, although somewhat arbitrary, the specific time chosen (usually immediately before European settlement) is based on an understanding of historic species composition and anthropogenic disturbances. Although restoring an area to the estimated, historical vegetation types is widely accepted, the exclusory nature of the restoration process often actively eliminates not just invasive species, but also non-invasive, nonnative species as well as displaced native species. These exclusory activities echo patterns of domination and degradation that led to a need for restoration in the first place. Although the domination present in restoration stems from an earnest desire to repair harms inflicted by human carelessness, it at the same time enforces a human conception of the ideal landscape. Attending to ecofeminist concepts such as inclusivism and pluralism, and embracing their rejection of dualistic thinking and the logic of domination demands an expanded tolerance within the practice of ecological restoration. An expanded ecofeminist conceptualization of restoration, a restorashyn, attempts to reduce the presence of overt human domination of the land. Doing so may ultimately mean that the species composition of an ecofeminist restorashyn will not be purely native, but may instead include a diverse mix of both native and non-invasive, nonnative species. Palmer, Clare, Environmental Ethics and Process Thinking. Oxford: Clarendon Press, Oxford University Press, 1998. 243 pages. Palmer challenges the view that process thinking offers an unambiguously positive contribution to the philosophical debate on environmental ethics. She explores the approaches to ethics which may be drawn out of the work of process thinkers such as A. N. Whitehead and Charles Hartshorne, raising questions about the implications of such approaches for justice and individual integrity. She compares the ethics of process thinking with a variety of other approaches to environmental ethics, concluding that these raise a number of difficulties relating to process thinking about the environment. Although she does offer some reformations of process thinking in an attempt to address such difficulties, she suggests that a question mark remains over what process thinking can contribute to environmental ethics. Palmer is in Religious Studies at the University of Stirling, Scotland. (v.9,#3)

Palmer, Clare, "The Idea of the Domesticated Animal Contract," Environmental Values 6(1997):411-425. ABSTRACT: Some recent works have suggested that the relationship between human beings and

domesticated animals might be described as contractual. This paper explores how the idea of such an animal contract might relate to key characteristics of social contract theory, in particular to issues of the change in state from nature to culture, issues of free consent and irrevocability; and the benefits and losses to animals which might follow from such a contract. The paper concludes that there are important dissimilarities between a domesticated animal contract and other theories of social contract; and that contract language may be used to legitimate relationships of domination over domesticated animals. Department of Philosophy, University of Western Australia, Nedlands, Perth, WA 6009 Australia. (EV)

Palmer, Clare, "Response to Cobb and Menta," Process Studies 33.1 (2004):46-70. Palmer responds to John Cobb and Tim Menta who critiqued her Environmental Ethics and Process Thinking and also her "Animality, Civilization, and Savagery in the work of A. N. Whitehead." (v. 15, # 3)

Palmer, Clare, "Religion in the Making? Animality, Savagery, and Civilization in the Work of A. N. Whitehead," Society and Animals 5/november 2000, pp. 287-304. What is "human" as opposed to what is "animal" are frequent ways of distinguishing humans and, often unfortunately, of disparaging animals, perhaps under the concept of "savagery." A critique of Whitehead, especially his Religion in the Making, suggesting that using Whitehead to underpin modern work in theology and environmental ethics requires considerable caution. Palmer is in philosophy, Washington University, St. Louis. (v. 15, # 3)

Palmer, Clare, "Christianity, Englishness and the southern English countryside: a study of the work of H. J. Massingham," Social and Cultural Geography 3(no. 1, 2002):25-38. The relationship between Christianity, Englishness, and ideas about the southern English landscape in the writings of the 1930's and 1940's rural commentator H. J. Massingham. An example of religious and national identities in the context of national landscapes. A kind of "divine Englishness," an interesting example of one way in which theological reasoning can reflect and reinforce concepts of a naturally ordered national identity. Palmer is herself English, now in philosophy at Washington University, St. Louis. (v. 15, # 3)

Palmer, Clare, "Placing Animals in Urban Environmental Ethics," Journal of Social Philosophy 34(no. 1, 2003):64-78. Thinking about animals in urban environmental ethics. The complex nature of urban areas (which includes parks and natural areas) and the diversity of human-animal relationships within these areas (from pets to pests to bird-watching) raises very different questions for animal ethics than those raised within wilderness areas. Palmer is in philosophy, Washington University, St. Louis. (v. 15, # 3)

Palmer, Clare, "Madness and Animality in Michel Foucault's Madness and Civilization," in Peter Atterton and Matt Calarco, eds., Animal Philosophy: Essential Writings in Theory and Culture. Continuum Press, 2004. Difficulties that underlie Foucault's treatment of animality. Palmer is in philosophy, Washington University, St. Louis. (v. 15, # 3)

Palmer, Clare, ed., Teaching Environmental Ethics. Leiden and Boston: Brill Academic Press, 2006. This collection explores a wide variety of questions, both of a theoretical and a practical nature, raised by teaching environmental ethics. The essays consider general issues such as the place of environmental advocacy in the environmental ethics classroom; using outdoor environments to prompt reflection on environmental ethics; and handling student responses, such as anger and pessimism, that may emerge from teaching environmental ethics. The essays also explore more practical issues, including successfully teaching environmental ethics to students without a background in philosophy; promoting the development of interdisciplinarity in the classroom; useful ways to structure environmental ethics syllabi,

and teaching and learning techniques in environmental ethics. Fifteen essays and an introduction written by the editor.

Palmer, Clare. Animal Liberation, Environmental Ethics and Domestication. OCEES Research Paper No. 1. Oxford: Oxford Centre for the Environment, Ethics and Society, Mansfield College, 1995. 25 pp. A new taxonomy of human-animal relationships. A number of animals with which we most commonly interact "fit only very uneasily into either the category of "wild" or "domestic." We need categories for captive wild animals, scavenging animals, and feral animals, for example. Categories in terms of varying degrees of dependence on human beings are more adequate than those in terms of an unwritten contract of the kind proposed by Stephen Budiansky and endorsed with some qualification by Baird Callicott. At the same time, the different relationships we enjoy with animals of different categories may justify more variation in the way we treat them than would be allowed by the universalizing ethical theories of Regan and Singer. Palmer, Clare. "'Taming the Wild Profusion of Existing Things'? A Study of Foucault, Power, and Human/Animal Relationships." Environmental Ethics 23(2001):339-358. I explore how some aspects of Foucault's work on power can be applied to human/animal power relations. First, I argue that because animals behave as "beings that react" and can respond in different ways to human actions, in principle at least, Foucault's work can offer insights into human/animal power relations. However, many of these relations fall into the category of "domination," in which animals are unable to respond. Second, I examine different kinds of human power practices, in particular, ways in which humans construct animal constitutions and animal subjectivities. Finally, I use a case study of a pet cat to show how such power practices may come together in a single instance. (EE)

Palmer, Ronan. "From the Inside Out." Environmental Values 9(2000):411-418. Abstract: Environmental values are integral to the work of environmental regulators. However values are not simple concepts that can be 'applied' by the regulators. How they are taken on board will depend, inter alia, on the nature of the organisation, its staff and the issues it deals with. Because the environment is complex, the use of values, and in particular of monetary values, will also be complex. While certain ways of expressing values may not be without problems, they can still provide useful guidelines for action. An organisation uses both internal and external processes to develop and articulate values. The challenge is, over time, to integrate these processes and make them more meaningful.

Keywords: Appraisal, decision theory, organisation theory, valuation.

Paloheimo, Eero, Maan Tie (The Way of the Earth) Helsinki: Werner Söderström Osakeyhtiö, 1989. ISBN 951-0-16075-X. 250 pages. Paper. Paloheimo analyzes three dimensions of the world: the material, the psychical, and the conceptual, the latter found only in humans. Developing a spectrum of consciousness, he considers non-living beings, non-sentient living organisms, sentient life, and human consciousness. There is, further, a collective consciousness of the biosphere and humankind. In the second half of the book, Paloheimo asks about possibilities for a different kind of future world, as these depend on different kinds of collective consciousness. There are different psychical and material outcomes of the different kinds of collective consciousness. Analyzing the value of the diversity of life, he considers materialistic uses of the world, esthetic values in nature, and ethical duties to nature. What would an ideal observer think the world should be like? In result what should we do? We ought to dismiss the idea that the future is unknown and gain power, use it responsibly, make adequate choices, and follow with appropriate deeds. In addition to continental and Finnish philosophers, Paloheimo has

read extensively in English-speaking philosophers, including environmental philosophers. He is a member of the Finnish Parliament, with a doctorate in technology studies, the author of five other books. (v5,#2) (Finland)

Palovicová, Zuzana, "Problém Hodnôt v Environmentálnej Etike (The Value-Problem in Environmental Ethics)," Filozofia 51(no. 2, 1996):91-98. (In Slovak) An analysis of value in environmental ethics, with attention to the most important axiological theories, i.e. axiological individualism and axiological holism. A value theory adequate for the protection of the environment cannot be built on a merely subjective axiology. Value results from more objective human needs and from our human struggle to survive. "Systemic value" (Rolston) and "transformative value" (Norton) are analyzed, as is the relation between instrumental and intrinsic values. Also, Callicott, Regan, Singer. Panayotakis, Costas. "Environmental Ethics and Capitalism's Dialectic of Scarcity." Environmental Ethics 27 (2005):227-244. A non-productivist Marxism departing from the analysis of capitalism's "dialectic of scarcity" can make a valuable contribution to the field of Environmental Ethics. On the one hand, the analysis of capitalism's dialectic of scarcity shows that the ethical yardstick by which capitalism should be measured is immanent in this social system's dynamic tendencies. On the other hand, this analysis exposes capitalism's inability to fulfill the potential for an ecologically sustainable society without unnecessary human suffering that capitalism's technological dynamism generates. This argument can be illustrated by a critical analysis of Bjorn Lomborg's *The Skeptical Environmentalist*. An exploration of capitalism's dialectic of scarcity can bring to light those weaknesses and internal contradictions of anti-ecological discourses that are likely to escape the attention of non-Marxist ecologists. This analysis shows that to the extent capitalism's dialectic of scarcity encourages the fragmentation of social justice and environmental movements, a critical analysis of this dialectic can contribute to the formation of the alliance of emancipatory movements that the attainment of a just and ecologically sustainable society presupposes. Panksepp, Jaak, "Beyond a Joke: From Animal Laughter to Human Joy?" Science 308 (1 April 2005): 62-63. Rats "laugh," or at least chirp when they play, enjoy getting tickled, and come chirping back for more. Panksepp finds the neural circuits for laughter exist in ancient regions of the brain, also that children laugh when they hardly speak. Next he wants to find genes for joy. He concedes this may not be

a sense of humor. Also Panksepp, Jack, and Jeff Burgdorf, "'Laughing' Rats and the Evolutionary Antecedents of Human Joy?" Physiology and Behavior 79 (2003): 533-547.

Pannenberg, Wolfhart, Toward a Theology of Nature: Essays on Science and Faith. Edited by Ted Peters. Philadelphia: Westminster/John Knox Press, 1993. 208 pages. Paper. \$ 20.00. "Many scholars of religion sit timidly by waiting to hear what physicists and biologists say about the world of nature. Then, they adjust their religious vision accordingly. But not systematic theologian Wolfhart Pannenberg. Based on dialogue between theologians and scientists for more than three decades, Pannenberg poses theological questions to natural scientists ... He says the scientific view of nature is incomplete and challenges scientists to incorporate the idea of God into their picture of nature. He reviews the relationship between natural law and contingency, the importance of the spirit in the phenomenon of life, field theory language, and the theological account for the nature of God and of God's creative activity. Pannenberg believes the world we live in is a creature of a creating God, and unless we understand this, we cannot fully understand the world." Pannenberg is professor of systematic theology at the University of Munich. (v4,#4)

Panusz, Filip Henryk, Bodily Work and Value: Merleau-Ponty, Marx and Environmental Ethics. M.A. thesis, Colorado State University, spring 2002. A quasi-materialist approach to value theory. Bodily work is one of the means through which values arise, as with laboring on the land. Values are not created out of pure mind. They are not discovered through pure reason, independently of the material manifold that surrounds us. It is impossible to speak of value without phenomenological inquiry into the subject's immediate experience of the world.

Value is first approached here through Merleau-Ponty's phenomenology of the lived body and the Life-world. Continuing, values are not intellectual beliefs that one "has." A value exists when it is "lived." Value is next approached through Karl Marx's critique of idealism and his materialist emphasis upon praxis, as expressed in the labor theory of value.

Among the consequences for environmental ethics are that (a) environmental education must educate entire embodied beings, that (b) isolation from the sensuous environment may have deleterious ethical consequences, and (c) that some kinds of physical work on the land are particularly fruitful and salubrious in invoking a moral sense within the laborer. Panusz is originally from Poland, now resident in the United States. (v.13,#2)

Parker, Kelly, "Economics, Sustainable Growth, and Community." Environmental Values Vol.2 No.3(1993):233-246. ABSTRACT: Sustainable growth is emerging as a normative concept in recent work in economics and environmental philosophy. This paper examines several kinds of growth, seeking to identify a sustainable form which could be adopted as normative for human society. The conceptions of growth expressed in standard economic theory, in the writings of John Dewey, and in population biology, each suggest particular accounts of how the lives of individuals and communities ought to be lived. I argue that, while absolute sustainability is not possible, the latter two conceptions together suggest a regulative ideal of sustainable growth which is acceptable at the social level, and which encourages the development of genuine community. KEYWORDS: Economics, ethics, sustainable, growth, development. Department of Philosophy, 214 Lake Superior Hall, Grand Valley State University, Allendale MI 49401, USA.

Parker, Kelly, "The Values of a Habitat," Environmental Ethics 12(1990):353-368. This is only the third article to use pragmatism as a basis for an environmental ethic to appear in Environmental Ethics. Pragmatism stresses the end of dualisms that pervade ethical thought and environmental philosophy and policy. Parker attempts to reduce the dichotomy between natural and artificial habitats, but he errs in relying on the human valuation of natural habitats. Parker suggests that the values of "adequacy" and

"significance" can be applied to both natural and artificial habitats---but the evaluations are all based on human affective relationships (see p. 368). (Katz, Bibl # 2)

Parker, Kelly. "The Values of a Habitat." Environmental Ethics 12(1990):353-68. Recent severe environmental crises have brought us to recognize the need for a broad reevaluation of the relation of humans to their environments. I suggest that we consider the human-nature relation from two overlapping perspectives, each informed by the pragmatic philosophy of experience. The first is an anthropology, according to which humans are viewed as being radically continuous with their environments. The second is a comprehensive ecology, according to which both "natural" and "nonnatural" environments are studied as artificial habitats of the human organism (i.e., as artifacts). The pragmatic approach has two features which make it promising as a way to ground environmental thinking. First, it allows us to avoid a human-nature dichotomy and the many problems which that dichotomy has traditionally engendered. Second, it ties environmental questions to a common cultural experience and a philosophical position from which environmentalists can effectively engage main-stream educational and political discussions. Parker is in the philosophy department, Vanderbilt University, Nashville, TN. (EE)

Parkes, Graham. "Nietzsche's Environmental Philosophy: A Trans-European Perspective." Environmental Ethics 27 (2005):77-91. Against the background of a growing interest in Nietzsche's moral philosophy, several articles have appeared in these pages in recent years dealing with his relation to Environmental Ethics. While there is much here that is helpful, these essays still fail to do full justice to Nietzsche's understanding of optimal human relations to the natural world. The context of his life helps to highlight some ecological aspects to his thinking that tend to be overlooked. His ideas about the Overhuman in Thus Spoke Zarathustra undermine the traditional anthropocentric attitude toward nature. By understanding Nietzsche's idea of will to power primarily as interpretation, following his suggestion that we engage the world as a play of interpretive forces, and paying attention to the relevant parallels with Chinese Daoism and Mahāyāna Buddhism, it is clear that Nietzsche takes a salutary step beyond biocentrism to a Dionysian celebration of existence as a whole. Parsons, Glenn. "The Aesthetic Value of Animals." *Environmental Ethics* 29(2007):151-169. Although recent work in philosophical aesthetics has brought welcome attention to the beauty of nature, the aesthetic appreciation of animals remains rarely discussed. The existence of this gap in aesthetic theory can be traced to certain ethical difficulties with aesthetically appreciating animals. These difficulties can be avoided by focusing on the aesthetic quality of "looking fit for function." This approach to animal beauty can be defended against the view that "looking fit" is a non-aesthetic quality and against Edmund Burke's famous critique of the connection between fitness and the beauty of animals. Parton, Glenn, "The Rise of Primitivism and the Fall of Civilization: A Reply to J.B. Callicott and Holmes Rolston, III, on Wilderness," The Environmental Professional 16(1994):366-373. Wilderness is a medium that enfolds everything, not something "out there" independently of humans. Wilderness ought to be the habitat for humans. Civilization terminates wilderness and the good of beings who dwell there, including humans. Primitivism, reemerging as an alternative form of life, is a matter of correcting and undoing that fatal fork in the road that exiled us from our homeland. The price of the goods and services of civilization is too high. We humans should not have come out of the wilderness and we can and should go back to living and working in the wild. That primitive freedom and happiness cannot be surpassed, but only marred and lost. Callicott and Rolston are caught in a people vs. no-people in the wilderness argument, when real people must be in the wilderness, not in civilization. Parton is with the South Fork Mountain Defense in Weaverville, CA. (v5,#4)

Parton, Glenn. "Humans-in-the-Wilderness." Trumpeter 12, no. 4 (Fall 1995): 185-90. Parton proposes that civilization is not a linear development but includes wrong turns. What needs to be carried forward are the achievements, not the wrong parts. Humans should return the wilderness but not forfeit all the achievements of civilization.

Parton, Glenn. "The Rise of Primitivism and the Fall of Civilization: A Reply to J. B. Callicott and Holmes Rolston, III, on Wilderness." The Environmental Professional 16 (1994): 366-71. Parton offers criticism on the debate on wilderness between Callicott and Rolston in The Environmental Professional 13, no. 3 and no. 4. Parton argues that wilderness is a medium that enfolds everything. It is not the far-removed place "out there" envisioned by Callicott and Rolston. Wilderness is common ground for humans and nonhumans. Parton expects slow convergence in environmental work toward this conception of wilderness. (v6,#1)

Partridge, Ernest, "How Much is Too Much?" in Environmental Challenges to Business, The Ruffin Series No. 2, Society for Business Ethics, 2000. Criticizes Mark Sagoff's contention that "technology can deliver greater and greater abundance [and that] the endless expansion of the global economy is physically possible." In response: (a) prices are false indicators of sustainability, (b) close inspection reveals limitations in all basic resource categories--food, forests, water and energy. (c) Sagoff and other technological optimists ignore the fundamental physical principle of entropy. (EE v.12,#1)

Partridge, Ernest, "Should We Seek a Better Future?" Ethics and the Environment 3(1998):81-95. The radical contingencies attending human reproduction indicate that attempts to improve the living conditions of future generations result in generations populated by different individuals than would otherwise have been born. This remarkable consequence challenges the widespread belief that the present generation has responsibilities to its remote successors. I contend, first, that while the radical genetic contingency and epistemological indeterminacy of future persons absolves us of obligations to act "in behalf of" them as individuals, this moral absolution does not entail a permission to disregard entirely the remote consequences of our policies. Since relevant moral principles bind us to persons in general, not to particular individuals, we remain obligated to improve the life prospects of whatever individuals eventually com into being. Second, I suggest that by applying an analogous argument within the lives of persons rather than to the long history of civilization, we arrive at the morally repugnant result of negating long-term obligations to contemporary persons. Conversely, the condition of continuity which afford moral legitimacy to personal obligations among contemporaries likewise entails moral responsibility for the life conditions of distant generations. Partridge is in philosophy, University of California, Riverside. (E&E)

Partridge, Ernest, ed. Responsibilities to Future Generations. Reviewed in Environmental Ethics 4(1982):75-83.

Partridge, Ernest, "Nature as a Moral Resource," Environmental Ethics 6(1984):101-130. An attempt to find a nonprudential and disinterested reason for humans to preserve nature. Nature fulfills the human need for a self-transcending concern that enriches human life. But if nature is a "moral resource" it is still a resource, instrumentally valuable. This may be a "higher level" interest than hunting or powerboating, but it is still basically prudential. (Katz, Bibl # 1)

Partridge, Ernest, "Three Wrong Leads in a Search for an Environmental Ethic: Tom Regan on Animal Rights, Inherent Values, and 'Deep Ecology.'" Ethics and Animals vol. 5, no. 3 (September 1984): 61-74. Partridge begins by criticizing Regan's views of environmental ethics because his notion of "inherent value" is non-relational and hence meaningless, and because his concern for individual animals is not in the least "ecological." Partridge then proposes a synthesis of individualism and holism in environmental ethics by devising a sliding scale of individual worth based on sentience. This is an important paper representing central issues in environmental ethics. (Katz, Bibl # 1)

Partridge, Ernest, "The Tonic of Wildness," in Sharpe, Virginia A., Norton, Bryan G, and Donnelley, Strachan, eds., Wolves and Human Communities. Washington, DC: Island Press, 2001. Experiences of natural and artistic beauty are contrasted: Natural beauty is uncomposed and unframed, and includes the subject in the natural context. Concludes that the experience of wildness teaches us "of our origins, our sustenance, our limitation, and our planetary home. From such lessons ... we ... gain the perspective, appreciation and motivation to preserve our natural estate, and with it our sustainable place within it." (EE v.12,#1)

Partridge, Ernest, "Gefährlicher Optimismus (Perilous optimism)". In German. Natur und Kultur 2(no. 1,2001):3-32. Abstract: Despite the warnings by the environmentalists of impending disasters due to the destruction of the natural environment and the exhaustion of natural resources, there is no shortage of reassurances. The optimists find support in the economic principle that all problems of scarcity and growth limitation can be solved through human ingenuity and economic incentives. This optimism is indefensible because 'market forces' are systematically 'myopic,' e.g., oriented toward short-term projections and returns on investment. Furthermore, the optimists disregard well-established facts of biological and natural sciences; in particular the complexity of ecosystems and the natural entropic progression of systems toward disorder and dispersion. (v.12,#2)

Partridge, Ernest, "Future Generations," in Jamieson, Dale, ed., A Companion to Environmental Philosophy, London: Blackwells, 2001. Survey of recent philosophical responses to the problem of the responsibility to future generations. Among them: Libertarianism, Utilitarianism, Communitarianism (de-Shalit), Contractarianism (Rawls). The problem of motivating the living generation to make provision to the remote future. Some policy guidelines are offered for just provision for remote posterity. (EE v.12,#1)

Partridge, Ernest, "Reconstructing Ecology," in Pimentel, David, Westra, Laura, and Noss, Reed F., eds. Ecological Integrity: Integrating Environment, Conservation, and Health (Washington, DC: Island Press, 2000). Answers recent attacks on such cherished ecological concepts as "stability," "equilibrium," "integrity" and "community," by such biologists as Michael Soulé and Daniel Botkin, and by the philosopher Mark Sagoff. Granted, many "classical ecologists" have overstated these concepts. However, the opposing account of nature as a chaotic "hodgepodge" of coexisting species is indefensible. Evolution presupposes order, stability, and symbiosis among species, albeit within a condition of constant change. Ecological theory is falsifiable and predictive, and employs valid classification schemes. Finally, normative terms such as "ecosystemic health" and "integrity" are meaningful. (EE v.12,#1)

Partridge, Ernest, "The Future - For Better or Worse," Environmental Values 11(2002):75-85. Alan Carter correctly argues that Thomas Schwartz's "future persons paradox" applies with equal force to

utilitarianism, rights theory and Aristotelian ethics. His criticism of Rawls "justice between generations" is less successful, because of his failure (and perhaps Rawls as well) to fully appreciate the hypothetical nature of the "original position". Carter's attempt to refute Schwartz's argument by focusing on the individuality of moral action fails, since it evades the essential point of Schwartz's argument. The best response to Schwartz is to concede the essential validity of his argument and then to turn that argument into an ad absurdum refutation of his central premise, "the person affecting principle". (EV)

Partridge, Ernest. "If Environmental Education Is the Answer, Then What Is the Question?" Annual Hulings Lecture, Northland College, February 15, 1995. How did Western civilization fall into the environmental trap in which we now find ourselves? We did so by allowing our cleverness to outpace our intelligence, our facility to outdistance our foresight, and our decision-making procedures to evolve without moral charts and compasses, secure in the belief that our lives and institutions were being moved by such benign "invisible hands" as consumer preferences, market forces, and cultural drift. If environmental education is the answer, then many questions follow: How do we get environmental education into the college and university curriculum? Copies from Ernest Partridge, Northland College, Ashland, WI 54806. (v6,#1)

Partridge, Ernest. "Are We Ready for an Ecological Morality?" Environmental Ethics 4(1982):175-90. This essay is an inquiry into the relevance of psychology to morality--particularly, the relevance of a capacity to treat nature with respect and restraint to a responsibility to do so. I begin with a presentation of Aldo Leopold's "land ethic" (which I also designate with the term ecological morality). I then examine two notions of moral psychology that have recently attracted the interest of moral philosophers: first, "the moral sense," a concept that has gained prominence, in part, through the recent work of the philosopher, John Rawls; and second, Lawrence Kohlberg's theory of the development of moral cognition. Finally, I consider how these perspectives on moral psychology might apply to ecological morality. Partridge is in Environmental Studies, University of California, Santa Barbara, CA. (EE)

Partridge, Ernest. "Nature as a Moral Resource." Environmental Ethics 6(1984):101-30. In this paper I attempt a moral justification of protecting wild species, ecosystems, and landscapes, a justification not directly grounded in appeals to human benefit. I begin with a description of anthropocentric and ecosystemic approaches to the valuing of nature and offer some empirical arguments in support of the

ecosystemic view. I suggest that human beings have a genetic need for natural environments, and that the direct experience of wild nature is an intrinsic good. Theoretical coherence and scope is another advantage of the ecological perspective over the anthropocentric view. Turning to moral psychology, I argue that human beings have a fundamental need to care for things outside themselves and that this need is suitably met, and human life enriched, by a transcending concern for the wellbeing of natural species, habitats, and ecosystems. These considerations are joined with the ecological point of view to yield the conclusion that a self-transcending concern for the welfare of wild species and their habitats enriches the quality of moral life. Persons with genuine reverence and respect for wild creatures and their habitats will enjoy greater fulfillment in their own lives and be better neighbors to each other. Partridge is at the Center for the Study of Value and Social Policy, University of Colorado, Boulder, CO. (EE)

Partridge, Ernest, "Ecological Morality and Nonmoral Sentiments," Environmental Ethics 18(1996):149-163. A complete environmental ethic must include a theory of motivation to assure that the demands of that ethic are within the capacity of human beings. J. Baird Callicott has argued that these requisite sentiments may be found in the moral psychology of David Hume, enriched by the insights of Charles Darwin. I reply that, on the contrary, Humean moral sentiments are more likely to incline one to anthropocentrism than to Aldo Leopold's land ethic, which is defended by Callicott. This mismatch becomes more evident as Callicott attempts to enlist Humean moral sentiments in support of the Leopoldian 'land community.' The disanalogies between human and natural communities, I argue, are too great to permit this application. The motivation we need to meet our duties as 'citizens of the land community' must be of a nonmoral kind. I suggest that the necessary sentiments may be found in a genetically based 'affirmation of nature' that has evolved out of our natural history as a species, shaped by the very forces and contexts that are now put in peril by our technology. Partridge teaches at Northland College, Ashland, WI. (EE)

Pascalev, Mario, "Maps and Entitlement to Territory," Philosophy and Geography 2 (1998): 233-247. Pascalev is a Ph.D. candidate in the Department of Philosophy at Bowling Green State University. (P&G)

Paske, Gerald H., "Why Animals Have No Right To Life: A Response to Regan", Australasian Journal of Philosophy, 66 (1988): 498-511. It is argued that the right to life is based upon abstract rationality and that thus moral agents but not moral patients have a right to life. Regan's argument, that appeals to rationality are "'perfectionistic" and hence unacceptable, is examined and rejected. Abstract rationality makes possible (1) abstract sympathy and (2) the evaluation and alteration of one's own feelings and desires. This generates moral agency and makes moral agents subject to a unique type of harm: deontic harm. Death is a deontic harm and hence is uniquely harmful to moral agents. Consequences of this thesis are (1) there are two independent, fundamental moral principles, (2) there are degrees of inherent value, (3) some animals have greater moral standing than some humans, and (4) some genetic humans

have greater moral standing than other genetic humans. The dangers inherent in such views are briefly assessed.

Paske, Gerald H., "The Life Principle: A (Metaethical) Rejection." Journal of Applied Philosophy 6 (1989): 219-225. Critical discussion of Paul Taylor's "life-principle" or biocentric ethic. Paske argues that Taylor has made an arbitrary distinction between nonsentient living entities and inanimate objects; and the crucial mistake is a narrow interpretation of teleology as being "goal-directed." "But nonsentient life is not conscious and hence, literally, has no goals...The real difference between stalactites and protozoa is that stalactites come about by a physical-chemical process whereas protozoa come about via biophysical and bio-chemical processes" (p. 224). This difference is not a relevant moral distinction. Most discussions of Taylor focus on the policy implications of his view; this argument addresses the foundation. (Katz, Bibl # 2)

Passmore, John, Man's Responsibility for Nature. New York: Scribner's, 1974.

Passmore, John, "The Preservationist Syndrome," Journal of Political Philosophy 3(#1, 1995):1-22. Passmore wishes more consistent use of "conservation" and "preservation." Conservation is future-oriented; preservation is past-oriented. In the rapidly changing modern world, the rise of preservationist interests is striking. Passmore considers urban preservation, ecological preservation, cultural preservation, versus development, the question of "rights" to development, indigenous "rights" to traditional lands, "rights" of animals to be preserved, "rights" of species, whether to say that preservation is "better" is culturally relative, whether preservationists are elitists. The paper, he notes, is a development and generalization of Chapters IV and V in his Man's Responsibility for Nature (London: Duckworth, 1980). Passmore is retired, Australian National University, Canberra. He will speak at the forthcoming World Congress of Philosophy, Boston, August 1997. (v8,#3)

Paterson, B, "Ethics for Wildlife Conservation: Overcoming the Human-Nature Dualism," BioScience 56 (no. 2, February 2006): 144-150. This article contrasts the instrumental value approach, extensionist approach, and biocentric approach to environmental ethics with the Buddhist approach of Daisaku Ikeda in terms of their meaning for wildlife conservation. I argue that both anthropocentric and biocentric approaches create a false dichotomy between humans and nature and are not helpful to modern wildlife conservation, which aims to balance the needs of people with the conservation of nature. The views of Daisaku Ikeda, in particular the principle of dependent origination and the theory of the oneness of life and its environment, constitute an alternative approach that places people within the web of all living things.

Patterson, Charles, Eternal Treblinka: Our Treatment of Animals and the Holocaust. With a title from one of the stories of the Yiddish writer and Nobel Laureate Isaac Bashevis Singer (1904-91): "In relation to them, all people are Nazis; for the animals it is an eternal Treblinka." Human beings, throughout history, have perpetrated terrible wrongs on non-human animals. (v.12,#4)

Patterson, John, Exploring Maori Values (Palmerston North, New Zealand: The Dunmore Press, 1992). Paper, 191 pages. In the Maori environmental philosophy, humans (or at least the Maori) are related to all items in the world--to the trees, birds, and fish, also to the mountains, rivers, and the land herself--to Papatuanuki, mother of all. These kinship links entail that we must respect and enhance the world in which we live. Patterson spells out some traditional and contemporary statements of this environmental philosophy and works out some radical implications for contemporary western societies. Patterson is senior lecturer in philosophy at Massey University, Palmerston North, New Zealand. He invites correspondence from others doing related work in other parts of the world. (v3,#1)

Patterson, John, "Maori Environmental Virtues." Environmental Ethics 16(1994):397-409. The standard sources for Maori ethics are the traditional narratives. These depict all things in the environment as sharing a common ancestry, and as thereby required, ideally, to exhibit certain virtues of respect and responsibility for each other. These environmental virtues are expressed in terms of distinctively Maori concepts: respect for mauri and tapu, kaitiakitanga, whanaungatanga, manaakitanga, and environmental balance. I briefly explore these Maori environmental virtues, and draw from them some messages for the

world at large. Patterson is with the Dept. of Philosophy, Massey University, New Zealand. (EE)

Patterson, John. "Environmental Mana." Environmental Ethics 21(1999):267-276. In Maori tradition, all creatures are naturally sacred or tapu, and cannot be used without ritual removal of the tapu, a symbolic acknowledgment of the mana of the gods concerned. Although there is a religious dimension to tapu, it is also the natural state of all creatures, reflecting the idea that they have intrinsic worth. The theist aspect of tapu can be bypassed: tapu is the mana of the atua or gods, who can be seen as personifications of or indeed identical with areas of the natural world. In this way, the mana of the gods is seen as the mana of nature itself, and respect for the tapu of a creature turns out quite like the familiar idea of respect for its intrinsic value or its ecological value. We might conclude that the environmental mana of the human species is currently negative, and this conclusion in turn might persuade us to change our ways. (EE)

Paul, Ellen Frankel. Property Rights and Eminent Domain. Reviewed in Environmental Ethics 11(1989):179-89.

Paul, Ellen Frankel. "The Just Takings Issue." Environmental Ethics 3(1981):309-28. Courts and legal commentators have been notoriously unsuccessful in articulating a rule to differentiate between uncompensated police power regulations of land by government and situations in which the government can only interfere with property rights if it provides compensation to those owners who suffer losses. Noticeably absent from most discussions of this "takings" issue is any foundational underpinning in a theory of justice with respect to property holdings. Can two of the most influential contemporary theories of justice--that of John Rawls and Robert Nozick--provide such needed support for the analysis of the "takings" issue? By employing the vehicle of three hypothetical examples I investigate this question and

reach some conclusions concerning the applicability of such abstract theories of justice to the real world. Paul is at the Institute for Social Philosophy and Policy, Bowling Green State University, Bowling Green, OH. (EE)

Paula, Lino, and Frans Birrer, "Including Public Perspectives in Industrial Biotechnology and the Biobased Economy," Journal of Agricultural and Environmental Ethics 19(2006):253-267. Industrial ("white") biotechnology promises to contribute to a more sustainable future. Compared to current production processes, cases have been identified where industrial biotechnology can decrease the amount of energy and raw materials used to make products and also reduce the amount of emissions and waste produced during production. However, switching from products based on chemical production processes and fossil fuels towards "biobased" products is at present not necessarily economically viable. This is especially true for bulk products, for example ethanol production from biomass. Therefore, scientists are also turning to genetic modification as a means to develop organisms that can produce at lower costs. These include not only micro-organisms, but also organisms used in agriculture for food and feed. The use of genetic modification for "deliberate release" purposes, in particular, has met great opposition in Europe. Many industrial biotechnology applications may, due to their scale, entail deliberate releases of GM organisms. Thus, the biobased economy brings back a familiar question; is it ethically justifiable, and acceptable to citizens, to expose the environment and society to the risks associated with GM, in order to protect that same environment and to sustain our affluent way of life? For a successful innovation towards a biobased economy, its proponents, especially producers, need to take into account (take responsibility for) such issues when developing new products and processes. These issues, and how scientists can interact with citizens about them in a timely way, are further explored in projects at Delft University and Leiden University, also in collaboration with Utrecht University. Keywords: industrial biotechnology - white biotechnology - genetic modification - dialogue - innovation. We include the field of genomics in our use of the term biotechnology. The authors are in the Institute of Biology, Biology and Society, Leiden University, Leiden, The Netherlands.

Pauley, John A., "The Value of Hunting," Journal of Value Inquiry 27(2003):233-244. The contemporary debate over hunting has focused primarily on the moral status of killing animals for sport. Is it really true, as many opponents of the hunt claim, that the end of hunting is simply the death of the prey? What does hunting require of a hunter and how does a hunter relate to prey and the environment of prey? Without complete answers to those questions, we run the considerable risk of making uninformed normative judgments about the practice of hunting. Pauley is in philosophy, Simpson College, Indianola, IA.

--Philippon, Daniel, Conserving Words: How American Nature Writers Shaped the Environmental Movement. Athens, GA: University of Georgia Press, 2004. How did American nature writers shape the environmental movement? To answer this difficult question, Philippon looks at five authors of seminal works of nature writing who also founded or revitalized important environmental organizations: Theodore Roosevelt and the Boone and Crockett Club, Mabel Osgood Wright and the National Audubon Society, John Muir and the Sierra Club, Aldo Leopold and the Wilderness Society, and Edward Abbey and Earth First! These writers used powerfully evocative and galvanizing metaphors for nature, metaphors that Philippon calls "conserving" words. Integrating literature, history, biography, and philosophy, this study explores how "conserving" words enabled narratives to convey environmental values as they explained how human beings should interact with the nonhuman world.

Peacock, Kent, ed., Living with the Earth: An Introduction to Environmental Philosophy. Toronto: Harcourt Brace and Co., Canada, 1996. 461 pages. Features Canadian authors, and, often, authors who are not professional philosophers. An anthology that can be read by individuals on their own, as well as used in an introductory class in environmental ethics. Section and chapter titles: Is there really an environmental crisis? Crisis in the skies: The ozone hole and global warming. Extinction is so final: The crisis in biodiversity. The human crisis: war, disease, poverty, and overpopulation. Soils and forests. Seeking a perspective (humans in relation to nature). What is the environment? Some views of the ecosystem. Symbiosis, parasitism, and commensalism. The Gaia hypothesis. Environmental ethics at last. Where ecology meets philosophy. Is anything sacred. Deep and shallow ecology. Hunting, trapping, and animal rights. Ecofeminism. Should we let the market decide? What is wealth? Sustainable development: Hypocrisy or best hope? Toward symbiosis. Can species be saved. The artifactual ecology.

"In this book, I have tended to give prominence to the impact of environmental degradation upon humans, and I have more than once suggested, or presented other authors who suggest, that human stewardship of the environment is a meaningful and desirable end. In the eyes of many, such views will be called 'arrogant' and 'anthropocentric.' And in some circles these days, to be found out as anthropocentric is a very grave thing indeed. And yet ... I resist being classified as either anthropocentric or biocentric exclusively. It seems to me that this categorization is beside the point if not harmful. I seek a view that recognizes both the special abilities and the special responsibilities of humans, and at the same time recognizes the dependency of humans upon nonhuman life and the relative insignificance of humans in the grand biotic scheme. To pretend that nonhuman life does not have intrinsic value, however philosophers may struggle to define such values, is indeed fatuous arrogance; to deny that humans do not have special capacities and a special place (for a whole at least) in nature on this planet is a simple abdication of responsibility. We have had enough of both, the arrogance and the abdication; now let's get on with the task of figuring out how to live with the Earth, instead of just on it" (p. 435). Pearce, David, "Green Economics." Environmental Values Vol.1 No.1(1992):3-14. ABSTRACT: Economists assume that people are fundamentally greedy, though not exclusively so. If environmental improvement is to be achieved, it will require policies that use selfishness rather than opposing it. Such policies are to be found in the basics of green economics in which market signals are modified by

environmental taxes and tradeable pollution certificates to 'decouple' the economic growth process from its environmental impact. Green economic policies avoid the infringements of human liberties implied in ever stronger 'command and control' measures. KEYWORDS: Sustainability, market based instruments, command and control. Centre for Social and Economic Research on the Global Environment, University College London, Gower Street, London WC1E 6BT, UK.

Pearce, David, Neil Adger, David Maddison and Dominic Moran. "Debt and the Environment." Scientific American 272 (no. 6, June 1995):52-56. Loans to Third World Countries cause great human hardship, but their connection to ecological troubles is difficult to prove. Most debtor nations continue to rely on outside funds, even though additional loans only make their predicament sharper. Structural adjustment programs are hard on people, especially the poor, but whether the environment has also been harmed directly in result is less clear. There is scant empirical evidence to suggest that the connection between debt and environment is significant. According to a common theory production of goods for export, to earn foreign exchange with which to pay debts, diverts resources away from the domestic sector producing goods for consumption at home, and this may be so, but the evidence that the environment is harmed in result is anecdotal and speculative. Most environmental degradation in the developing world probably has other causes than the servicing of debt. Pearce, the senior author, is in economics, University College, London. (v6,#3)

Pearce, David, "The Political Economy of the Global Environment," Scottish Journal of Political Philosophy 44(no.4, 1997):462-483. Many of the global agreements today are couched in terms of a common good. "If the economists of the Scottish empirical tradition were resurrected today and asked to advise on global environmental problems, we can hazard the judgement that they would not approve of the presumptions underlying the environmental agreements in force or being negotiated. They would have advised in favour of less government and less reliance on motives that run counter to Hume's 'self-love'. They would surely have identified a large area where mutual self-interest would enable the various stakeholders each to be better off with an agreement than they were without it. The framework for such global bargains does, indeed, involve governments, but in a fairly minimal role as facilitators, something Smith would surely have approved of. The Scottish tradition of political economy remains of great relevance. ... Environmental problems require practical and politically realistic solutions, the search for which also defines the Scottish tradition. If the global commons are to be saved, it is more likely that success will come from the pragmatists than from the moralists, and more likely still that it will come from a combination of the two, as in Scottish political economy" (p. 282). Pearce is in economics, University College, London, and University of East Anglia.

Pearce, David. "Dead in the Water." New Scientist, 4 February 1995. Attempts to save the grossly polluted Mediterranean Sea seem as doomed as the sea itself. The Mediterranean Action Plan, a convention organized by UNEP and agreed to 20 years ago by every nation bordering the sea (except Albania), has failed. More than 130 million people live along the coastline, with an additional 100 million tourists, and 80% of their sewage goes untreated into the sea. Add to that enormous amounts of industrial wastes and marine ecosystems are everywhere collapsing. (v6,#1)

has been reached that there is a discernible human influence on the climate. The main conclusions of this report. (v7,#4)

Pearce, Fred. *When the Rivers Run Dry: Water the Defining Crisis of the Twenty-First Century*. Boston: Beacon Press, 2006. Many rivers around the globe are overtapped and barely make it to the sea, especially where there are long dry seasons. Irrigation accounts for 70% of water consumption globally, including 90% of water consumption in many Asian countries. There is already much abandoned land as a result of failed irrigation from lack of water, often where water no longer flows downstream. Water, as much as oil, may drive politics and crises in the Middle East. The bottom line is efficiency or else.

Pearce, Neil E., and Douglas Crawford-Brown. "Sufficient Proof in the Scientific Justification of Environmental Actions." *Environmental Ethics* 11(1989):153-67. Environmental actions require a willingness to act, which, in turn, is stimulated partially by the belief that an action will yield the desired consequences. In determining whether an actor was justified in exerting the will to act, therefore, it is essential to examine the nature of evidence offered by the actor in support of any beliefs about the environment. In this paper we explore the points in environmental risk analyses at which evidence is brought to bear in support of inferences concerning environmental effects of regulatory actions. The intent is to provide a framework for discussing the manner in which evidence may provide a sufficient basis for ethically sound decisions for environmental actions. Pearce is at the Wellington Clinical School of Medicine, Wellington, New Zealand. Crawford-Brown is at the School of Public Health, University of North Carolina, Chapel Hill, NC. (EE)

Pearl, Mary C. and Newman, Scott, "Taking Responsibility for a New Disease," *San Francisco Chronicle*, May 7, 2003, p. A23. New human diseases often come from pathogens in animals, of which SARS may well be an example, seeming to have come from wild animals sold in Chinese markets. But these diseases have often been triggered in epidemic proportions because of human-caused disruptions on landscapes which stress the animals, and they spread because of human crowding on these landscapes and in cities. "By altering the normal balance between viruses, bacteria, and wildlife, we force infectious agents to evolve and adapt to new environmental conditions." Mary Pearl is a primatologist and president of World Life Trust. (v 14, #3)

Peerenboom, R. P. "Beyond Naturalism: A Reconstruction of Daoist Environmental Ethics." Environmental Ethics 13(1991):3-22. In this paper I challenge the traditional reading of Daoism as naturalism and the interpretation of wu wei as "acting naturally." I argue that such an interpretation is problematic and unhelpful to the would-be Daoist environmental ethicist. I then lay the groundwork for a philosophically viable environmental ethic by elucidating the pragmatic aspects of Daoist thought. While Daoism so interpreted is no panacea for all of our environmental ills, it does provide a methodology that may prove effective in alleviating some of our discomfort. Peerenboom is in the philosophy department, University of Hawaii at Manoa, Honolulu, HI. (Taoism) (China) (EE)

Peerman, Dean. "Unsportsmanlike Conduct." *Christian Century* Vol. 124, no. 5 (2007): 10-11. Peerman laments "canned hunts." There are some 1,000 canned hunt operations in the U.S., where, for thousands of dollars (\$20,000 for an oryx, ibex, impala, rhino, jaguar) a "so-called" hunter can kill an animal, fenced in a (so-called) preserve. Many of the more exotic animals are aging or ailing castoffs from prestigious zoos. If one includes release and shoot bird operations, there are 3,000 such canned hunts.

Pellizzoni, Luigi, "Uncertainty and Participatory Democracy," Environmental Values 12(2003): 195-224. The article deals with some implications of radical uncertainty for participatory democracy, and more precisely for Participatory Technology Assessment (PTA). Two main forms of PTA are discussed. One is aimed at involving lay citizens and highlighting public opinion. The other is addressed to stakeholder groups and organisations, not only in terms of interest mediation but also of inclusion of their insight into a problem. Radical uncertainty makes 'intractable' many environmental and technological issues and brings into question traditional and new approaches to policy-making. Its consequences are explored from the viewpoint of new science, deliberative democracy, and network governance. Radical uncertainty calls for a rethinking of the aims of public deliberation, and a reinterpretation of the divide between opinion- and position-oriented PTA. To look for a public opinion, understood as a shared principled view, can prove misleading, as can thinking of stakeholder participatory arrangements in the usual way. When facts and values overlap, and are deeply controversial, the only opportunity for mutual understanding may be to look for practical, 'local' answers, based on different positional insights. Moreover, radical uncertainty also affects interest determination and pursuit, and may enhance the opportunity of joint, inclusive, non-strategic issue definition and solution-devising. This vision of public deliberation is consistent with

the idea of network governance. However, fragmentation can affect the effectiveness and legitimacy of participatory policies. Trying to handle fragmentation from the top, as many suggest, is unlikely to be successful. A more promising endeavour is to foster deliberative settings which, although positioned at the level of 'local' and often contingent networks and commonalities, are open to include 'Otherness' - other contexts, other problem definitions, other concerns.

Pence, Gregory E., ed., The Ethics of Food: A Reader for the 21st Century. Lanham, MD: Roman and Littlefield, 2002. The moral questions surrounding food production, modification, consumption, particularly their global impact upon ecosystems. The ongoing tension between food biotechnologies and biodiversity, and some reasonable resolutions. Pence is in both the School of Medicine and the Department of Philosophy at the University of Alabama. (v.13,#1)

Pendery, Bruce M. "Reforming Livestock Grazing on the Public Domain: Ecosystem Management-Based Standards and Guidelines Blaze a New Path for Range Management," Environmental Law 27(no.2, 1997):513. In 1995, the Bureau of Land Management (BLM) amended livestock grazing regulations on public lands based largely upon a final environmental impact statement entitled Rangeland Reform '94. These amendments broke from the previous method that had been traditionally used by the BLM for administering grazing permits by establishing new administrative standards and guidelines that embrace some of the ecosystem management-based standards published by the National Research Council. Pendery details the rulemaking effort used to develop the new regulations, including a review of the legal history behind public land grazing and summaries of the modern-day arguments between range scientists, ranchers, and environmentalists. (v8,#3)

Pennisi, Elizabeth, "New Threat Seen from Carbon Dioxide," Science 279(1998):989. Increasing atmospheric carbon dioxide is having an adverse effect on coral reefs. Even though these are highly

carbonate systems, they are more sensitive to minor shifts in the carbon in seawater, influenced by carbon in the air, than previously thought. (v9,#1)

Pennisi, Elizabeth, "Brazil Wants Cut of Its Biological Bounty," *Science* 279(1998):1445. The Brazilian Senate is trying to pass legislation to ensure that Brazil's citizens share in any profits from crops or medicines derived from the biological wealth of the Amazon. But the legislators are finding it difficult to be precise about who should benefit, who has rights to the biodiversity, differentiating between scientific collecting and bioprospecting, and wondering whether such legislation will stimulate or discourage bioprospecting. Linger in memory is still-smoldering anger from the early 1900's when rubber trees were transplanted to Southeast Asia, which the Brazilians widely regarded as being stolen. (v9,#1)

Pennisi, Elizabeth, "ShakeUp to Proceed, but Conservation Center Stays Open," *Science* 292(2001):1034-1035. Grossman, Lev, "Mr. Small at the Smithsonian: Cutbacks in Conservation," *Time*, May 8, 2001, p. 57. Lawrence Small, the new Secretary of the Smithsonian, tried hard to close the Conservation Research Center (budget 5.2 million annually) to save money, at the same time that he continued renting for the Zoo two pandas from the Chinese (rental \$ 10 million annually). He claimed the pandas are good publicity and help to raise money for Smithsonian. Small is a banker appointed to revise Smithsonian finances; previous secretaries have been scientists. His proposal provoked enormous protests from conservation biologists, and he has relented, for the time being. (v.12,#2)

Pennisi, Elizabeth, "New Insect Order Speaks to Life's Diversity," *Science* 296(19 April 2002):445-446. A new species of insect has been discovered that is placed in a new order, the first new insect order in almost a century. There are three known specimens from Tanzania and Namibia, and, marvelously, a specimen preserved for 45 million years in amber. The new order has been named Mantophasmatodea. The insects are carnivorous and stick-like. (v.13,#2)

Pennisi, Elizabeth, "A Shaggy Dog History," *Science* 298(22 November 2002):1540-1542. The dog is better than primates at communication with humans. The origin(s) of the domestication of dogs remains in dispute, probably in China, from a Chinese wolf. With several other articles in this issue on the genetics and behaviors of dogs, a remarkably flexible species. (v.13,#4)

Pennisi, Elizabeth, "Social Animals Prove their Smarts," *Science* 312(23 June 2006):1734-1738. A new generation of experiments reveals that group-living animals have a surprising degree of intelligence. There has been ongoing debate about whether primates have a theory of mind. New experiments suggest they know what other primates know and intend particularly when food is involved, at least picking up behavioral cues. Nevertheless they lack the ability to realize that another individual is thinking something wrong or that it has a false belief, which some regard as a critical test of a theory of mind. Others think symbolic language is required for the transmission of ideas from mind to mind. Meanwhile, scrub jays also notice who knows where the food is hidden, and few think this requires a theory of mind. See Emery, N. J., and N. S. Clayton, "Effects of Experience and Social Context on Prospective Caching by Scrub Jays," *Nature* 414(22 November 2001):443-446. So the debate about precursors of theory of mind in animals continues.

Pepper, David, "Tensions and Dilemmas of Ecotopianism," *Environmental Values* 16(2007): 289-312. This paper examines some of many tensions associated with the utopian propensity that underlies much thinking and action in radical environmentalism. They include the tensions inherent within ecotopianism's approach to social change, its desire to embrace ecological universals, its general propensity to face Janus-like in the direction of both modernity and post-modernity, and its tendency towards a polarised stance on scale, and local and global issues. These tensions create dilemmas that are not merely of academic interest: they have practical, tactical and strategic implications, affecting the environmental movement's 'transgressive' potential in the search for ecotopia. Pepper is in geography, Oxford Brookes University, Oxford, UK.

Pepperberg, Irene Maxine, The Alex Studies: Cognitive and Communicative Abilities of Grey Parrots. Cambridge, MA: Harvard University Press, 1999. Alex is an African grey parrot, bought in a pet shop. Taught some language, he can classify objects according to color and substance, count up to six, understand the concepts of identity and difference, absence, and relative size. He can recognize that objects continue to exist even when hidden. He has four verbs: "want" (with variations), "go," "come here," and "tickle me." He can say "want corn" or "want grape," and "wanna go chair." It is difficult to test whether Alex can do this only after and because he has been taught language by social interaction with trainers (25 years of training), although Pepperberg maintains that language training affects only the ease with which animals can learn and not whether learning occurs. She takes considerable care not to overinterpret data, and questions remain about how and how much learning takes place in the wild. Meanwhile, bird-brained Alex is quite a talented bird! Pergams, Oliver R. W., and Patricia A. Zaradic. "Evidence for a Fundamental and Pervasive Shift away from Nature-based Recreation." *Proceedings of the National Academy of Sciences (PNAS)*, PNAS Early Edition (2008). Available online at:

<www.pnas.org/cgi/doi/10.1073/pnas.0709893105>. After fifty years of steady increase in *per capita* visits to natural parks, such as US national parks, visits have declined since 1987, with a cumulative downturn of 18% to 25%. There are similar trends in Japan. The downturn is in camping, hunting, and fishing, although not in hiking and backpacking. Other studies show that interest in conserving nature and environmentally responsible behavior correlate highly with direct contact with the natural environment, so declining nature participation has crucial implications for current conservation efforts. The authors suggest that a major cause is "videophilia" (increased electronic media/internet use). Pergams is in biology at the University of Illinois; Zaradic is in the Environmental Leadership Program at Bryn Mawr College.

Pergams, Oliver R.W., and Patricia A. Zaradic. "Evidence for a Fundamental and Pervasive Shift away from Nature-Based Recreation." *Proceedings of the National Academies of Science* Vol. 105, no. 7 (2008): 2295-2300. There is a general downward trend in nature recreation. Per capita visits to US national parks increased for fifty years prior to 1987, and have declined since. The authors examine this and similar data. Such a downturn will, they predict, lower interest in respect for and valuing of nature, and lower interest in conservation. They do find that hiking and backpacking increased, but consider this a small percent of the overall total, including park visits, hunting, fishing, bird-watching and more. See "Nature-based Outdoor Recreation Trends and Wilderness" by H. Ken Cordell, Carter J. Betz, and Gary T. Green (*International Journal of Wilderness* Vol. 14, no. 2 (2008): 7-9, 13).

Perhac, Jr., Ralph M. "Environmental Justice: The Issue of Disproportionality." *Environmental Ethics* 21(1999):81-92. It is widely held that environmental risks which are distributed unequally along racial or socioeconomic lines are necessarily distributed unjustly. While disproportionality may result from the perpetration of procedural injustices: what might be termed environmental racism, the question I am concerned with is whether disproportionality, in and of itself, constitutes injustice. I examine this question from the perspective of three prominent theories of justice that largely capture the range of our intuitions about fairness and justice: utilitarianism, natural rights theory, and (Rawlsian) contractarianism. While each of these theories provides clear grounds for objecting to the imposition of risk on individuals without their consent, none provides grounds for thinking that eliminating disproportionalities along racial or socioeconomic lines, in and of itself, is called for as a matter of justice. As a result, I suggest that the concern of environmental justice should lie with identifying (and protecting) those at greatest risk, rather than identifying correlations between average risk levels and morally arbitrary characteristics possessed by individuals, such as race or socioeconomic status. Perrett, Roy W. "Indigenous Rights and Environmental Justice." Environmental Ethics 20(1998):377-91. The modern environmental movement has a tradition of respect for indigenous cultures and many environmentalists believe that there are important ecological lessons to be learned from studying the traditional life styles of indigenous peoples. More recently, however, some environmentalists have become more sceptical. This scepticism has been sharpened by current concerns with the cause of indigenous rights. Indigenous peoples have repeatedly insisted on their rights to pursue traditional practices or to develop their lands, even when the exercise of these rights has implications in conflict with environmentalist values. These conflicts highlight some important questions in environmental ethics, particularly about the degree to which global environmental justice should be constrained by the recognition of indigenous rights. I explore some of these issues and argue for the relevance of the "capability approach" to environmental justice. Perrett is in philosophy, Massey University, Palmerston North, New Zealand. (EE)

Perz, Stephen, Robert Walker, Robert, and Marcellus Caldas. "Beyond Population and Environment: Household Demographic Life Cycles and Land Use Allocation Among Small Farms in the Amazon." *Human Ecology* Vol. 34, no. 6 (2006): 829-49.

Peter, Kenneth B. "Jefferson and the Independence of Generations." Thomas Jefferson's argument against long-term debt and his theory of usufruct are used to show why each generation is obligated to protect the independence of future generations. This argument forms the theory of "Jeffersonian generational independence." The theory has wide implications for the environmental movement because most environmental problems result in limitations on the liberty of future generations. I compare and defend Jeffersonian generational independence from two alternatives including the investment theory raised by

James Madison and the problem of generational interdependence raised by John Passmore or Edmund Burke. When the obligation to protect the independence of future generations is taken seriously, liberalism can no longer reasonably be used to defend environmental exploitation, since such exploitation amounts to an attack on the liberty and independence which form its core values. Environmental Ethics 24(2002):371-387. (EE)

Peterken, George F., Natural Woodland: Ecology and Conservation in Northern Temperate Regions. Cambridge: Cambridge University Press, 1996. A rationale and practice for woodland nature conservation and management. An account that is expectedly well informed scientifically, but is also surprisingly philosophically sophisticated about to what extent woods in Britain and in the United States can be considered "natural" in the light of various degrees of human influence, management, restoration. The book starts with an analysis of "the concept of naturalness," distinguishing (1) original-naturalness, (2) present-naturalness, (3) past-naturalness, (4) potential naturalness, and (5) future naturalness. Many woods are in a limbo between various qualities of naturalness. North America has forests with all these elements; such a forest would be rare in Europe. "It is more useful to regard naturalness as a continuous variable, ranging from completely natural (100% natural) to completely artificial (0% natural). In some cases such measures have to be differently applied in different parts of the same forest. An eight-point scale for past-natural woodlands with three differing systems of management. The importance of time lapse since the last management at various levels.

Selected studies in particular temperate and boreal forests, for example, the Joyce Kilmer Memorial Forest in North Carolina and the Bialowieza Forest, Poland. Indian influences on North American forests. (The records are equivocal; some U.S. forests were less "natural" than ecologists initially supposed. At the same time, though "the Indians certainly burned woodland close to home, elsewhere they merely augmented the naturally low frequency of lightning strike fires. Considerable areas of essentially natural forests thus awaited the European settlers" (p. 52). And much more. Peterken has served with various conservancy groups in the UK, such as the Nature Conservancy Council and the Joint Nature Conservation Committee. (v.14, #4)

Peters, Joe, "Transforming the Integrated Conservation and Development Project (ICDP) Approach: Observations From the Ranomafana National Park Project, Madagascar," Journal of Agricultural and Environmental Ethics 11(1998):17-47. ABSTRACT. Preservation of the biological diversity and ecosystems in protected areas can be achieved through projects linking conservation of the protected areas. with improved standards of living for resident peoples within surrounding buffer zones. This is the hypothetical claim of the integrated conservation and development project (ICDP) approach to protected area management. This paper, based on several years of experience with the Ranomafana National Park Project in Madagascar, questions the major assumptions of this approach from ethical and practical perspectives. The four basic strategies available to ICDPs: protected areas, buffer zones, compensation, and economic development, are analyzed and shown to be deficient or untested in the case of Ranomafana. Recommendations are made to explore conservation models other than the western conception of the national park, to modify the notion of a buffer zone outside the protected area, to redistribute money or other resources directly to the poor people living in and around the protected areas, and to eliminate the middle men in the development business. An appeal is made to focus on local education, organization and discipline in order to promote self-determination and self-reliance among resident peoples of protected areas. The paper argues that a public works program, similar to the Roosevelt administration's Civilian Conservation Corps of the 1930s, funded through a hard-currency endowment or other innovative financing mechanism, should be tried as a replacement for the currently questionable ICDP approach at Ranomafana. KEY WORDS: biodiversity, buffer zone, conservation, development, ethics, international aid, Madagascar, national parks, protected areas, slash-and-burn.

Peters, Robert H., A Critique for Ecology. New York: Cambridge University Press, 1991. 366 pages. \$ 30.00 paper. Argues that much of ecology cannot be science because ecology often provides no information or information of such poor quality that it can only be soft science. If ecology and environmental science are to meet the needs of the present decade and next millennium, researchers will need far more acute critical abilities than they have yet demonstrated. Ecologists have minimized the importance of predictive power in assessing scientific quality. Instead, they offer logical rationalization, historical explanation and mechanistic understanding, and fall prey to numerous failings that confound any assessment of the science. Predictions are often vague, inaccurate, qualitative, subjective, and inconsequential. But ecology can be effective and informative, and predictive ecology is already a reality in autecology, community ecology, limnology and ecotoxicology. A controversial book, about which the Cambridge editors themselves were much divided. Peters is in biology at McGill University, Montreal. (v5,#3)

Peterson, Anna. "Environmental Ethics and the Social Construction of Nature." *Environmental Ethics* 21(1999):339-357. Nature can be understood as socially constructed in two senses: in different cultures' interpretations of the nonhuman world and in the physical ways that humans have shaped even areas that they think of as "natural." Both understandings are important for environmental ethics insofar as they highlight the diversity of ways of viewing and living in nature. However, strong versions of the social constructionist argument contend that there is no "nature" apart from human discourse and practices. This claim is problematic both logically, insofar as it fails to deconstruct the notion of culture, and ethically, insofar as it categorically privileges human activities and traits. (EE)

Peterson, C. H. and Bishop, M. J., "Assessing the Environmental Impacts of Beach Nourishment," *Bioscience* 55(no. 10, October 2005): 887-896. With sea levels rising under global warming, dredge and fill programs are increasingly employed to protect coastal development from shoreline erosion. Such beach "nourishment" can bury shallow reefs and degrade other beach habitats, depressing nesting in sea turtles and reducing the densities of invertebrate prey for shorebirds, surf fishes, and crabs. Despite decades of agency mandated monitoring at great expense, much uncertainty about the biological impacts of beach nourishment nonetheless exists. Monitoring results are rarely used to scale mitigation to compensate for injured resources. Reform of agency practices is urgently needed as the risk of cumulative impacts grows.

Peterson, Markus J., and Peterson, Tarla Rai, "Ecology: Scientific, Deep and Feminist," Environmental Values 5(1996):123-146. The application of hierarchy theory to ecological systems presents those who

seek a radical change in human perspectives toward nature with a unique window of opportunity. Because hierarchy theory has enabled scientific ecologists to discover that the window through which one chooses to observe a system influences its reality, they may now be more amenable to including the perspectives of deep and feminist ecologists into their self-definition. A synergy between deep, feminist, and scientific ecology could improve environmental policy by encouraging more ecofeminists to encompass the marginalisation of nonhuman life-forms within the ethic of care, more deep ecologists to encompass the issues of overconsumption and militarisation within the anthropocentric-biocentric polarity, and more scientific ecologists to scrutinise the politics behind their investigations. KEYWORDS: Communication, deep ecology, ecofeminism, environmental policy, scientific ecology. (EV)

Peterson, Markus J. and Tarla Rai Peterson, "A Rhetorical Critique of `Nonmarket' Economic Valuations for Natural Resources." Environmental Values Vol.2 No.1(1993):47-66. ABSTRACT: Various `nonmarket' economic valuation methods have been used to compute `total' value of nonmarketed natural resources and related recreation. We first outline the history of these valuation techniques and use the Exxon Valdez disaster response and the valuation of whooping cranes, an endangered species, as examples of how these tools can constrain policy. We then explain how, by excluding non-economic social spheres, economic valuation techniques produce a terministic screen that deforms policy makers' vision of the ecological problems faced by society. Using Luhmann's functionalist social theory, we demonstrate that when natural resource managers privilege economic motives, they trivialize other social functions such as education, politics, religion and law. This process presents a significant ethical dilemma for democracies by first naturalizing, then ethicizing, existing patterns of domination. Petrucci, Mario. "Population: Time-Bomb or Smoke-Screen?" Environmental Values 9(2000):325-352. Abstract: 'Overpopulation' is often implicated as a major causative factor of poverty and environmental degradation in the developing world. This review of the population-resource debate focusses on Red, Green and neo-Malthusian ideologies to demonstrate how they have ramified into current economic and development theory. A central hypothesis is that key elements of Marxist analysis, tempered by the best of Green thought, still have much to offer the subject. The contributions of capitalism to 'underdevelopment', and its associated environmental crises, are clarified and reasserted in a contemporary context. The concept of valuation vector is also introduced, and a novel closure of Blaikie's 'Chain of Explanation' is proposed. The Circuit of Capital model thus created is applied to specific case-studies of resource-population conflict so as to overturn the simplistic conventional connection held between population growth and ecological devastation. The model highlights sequential causes of poverty arising from important capital-based factors which might otherwise be overlooked. It can accommodate a variety of Red-Green perspectives and its structural form is suited to the unravelling of complex population-resource pressures in the multi-dimensional space of the modern global political economy. KEYWORDS: Population, environment, Marxism, Green, Circuit of Capital, valuation vector. Petrucci is at ?? Pew Commission on Industrial Farm Animal Production, Final Report, 2008. *Putting Meat on the Table: Industrial Farm Animal Production in America*. Available online at: <<http://www.ncifap.org>>. This is a major report following a two and a half year study that concludes that industrial farm animal production as currently practiced poses unacceptable risks to public health, environmental safety and quality, and the welfare of the animals. The negative evidence is too great, and the scientific evidence is too strong to ignore. One of the major consultants on ethical issues was Bernard Rollin in the Department of Philosophy at Colorado State University.

Pezzey, John, "Sustainability: An Interdisciplinary Guide." Environmental Values Vol.1 No.4(1992):321-362. ABSTRACT: A definition of sustainability as maintaining 'utility' (average human wellbeing) over the very long term future is used to build ideas from physics, ecology, evolutionary biology, anthropology, history, philosophy, economics and psychology, into a coherent, interdisciplinary analysis of the potential for sustaining industrial civilization. This potential is highly uncertain, because it is hard to know how long the 'technology treadmill' of substituting accumulated tools and knowledge for declining natural resource inputs to production, can continue. Policies to make the treadmill work more efficiently, by controlling its pervasive environmental, social and psychological external costs, and policies to control population, will help to realize this potential. Unprecedented levels of global cooperation, among very unequal nations, will be essential for many of these policies to work effectively. Even then, tougher action may be required, motivated by an explicit moral concern for sustainability. An evolutionary analysis of history suggests that technology and morality can and will respond to a clearly perceived future threat to civilization; but we cannot easily predict the threat, or whether our response will be fast enough. KEYWORDS: Economics, environment, evolution, history, natural resources, policy, population, psychology, sustainability, technology. Leopold's writings "illustrate the ways in which wilderness is as much a rhetorical construction as a physical place." With much attention to metaphor. Philippon is in rhetoric at the University of Minnesota, Twin Cities. (v. 15, # 3)

Phillips, C. J. C. and Sorensen, J. Tind, "Sustainability in Cattle Production Systems", Journal of Agricultural and Environmental Ethics 6(1993):61-74. Cattle production has the potential of being an important component of sustainable agriculture globally. The ability to transform feed not suitable for humans into high-quality food will be of great importance in the long-term for feeding a growing population. To exploit the sustainable potential of cattle production systems, problems of pollution and of health and welfare, which are associated with cattle production are critically reviewed. The possibilities of integrating cattle production with other types of production are evaluated. The possibilities of using organic cattle production systems as prototypes of sustainable cattle production systems are explored. Phillips is in dairy research at the School of Agricultural and Forest Sciences, University College of North Wales, Bangor, Gwynedd. Sorensen is at the National Institute of Animal Science, Tjele, Denmark.

Phillips, Dana, "Thoreau's Aesthetics and 'The Domain of the Superlative,'" Environmental Values 15(2006): 293-305. Recently, 'ecocritics' have tried to show how literature might help us weather the global environmental crisis both emotionally and intellectually. Their arguments have been based, in part, on the assumption that despite its obvious strengths natural science has well-defined intellectual and ethical 'limits', and that environmental values are (therefore) best articulated by concerned humanists more in touch with the imagination. This essay addresses some of the problems faced by green humanists in their uneasy, mistrustful relationship with natural science, using passages from Thoreau as touchstone texts and juxtaposing those passages with remarks made by Bachelard, Coleridge, Stevens, Nietzsche, and Kant. (EV)

Phillips, Dana, The Truth of Ecology: Nature, Culture, Literature in America. Oxford: Oxford University Press, 2003. The contradictions of contemporary American nature writing, the need for greater theoretical sophistication, and the possibilities for a less devotional, "wilder" approach to ecocritical and environmental thinking.

Phillips, Robert A. and Reichart, Joel, "The Environment as Stakeholder? A Fairness-Based Approach," Journal of Business Ethics 23(2000):185- . (v.13, #3)

Phillips, Robert A., and Reichart, Joel, "The Environment as a Stakeholder: A Fairness-Based Approach," Journal of Business Ethics 23(2000):185-197. Stakeholder theory is often unable to distinguish those individuals and groups that are stakeholders from those that are not. This problem of stakeholder identity has recently been addressed by linking stakeholder theory to a Rawlsian principle of fairness. To

illustrate, the question of stakeholder status for the non-human environment is discussed. This essay criticizes a past attempt to ascribe stakeholder status to the non-human environment, which utilized a broad definition of the term "stakeholder." This paper then demonstrates how, despite the denial of stakeholder status, the environment is nonetheless accounted for on a fairness-based approach, through legitimate organizational stakeholders. In addition, since stakeholder theory has never claimed to be a comprehensive ethical scheme, it is argued that sound reason might exist for managers to consider their organization's impact on the environment that are not stakeholder related. Phillips teaches business, Georgetown University. Reichart teaches business, Fordham University.

Phillips, Sarah T. "Lessons From the Dust Bowl: Dryland Agriculture and Soil Erosion in the United States and South Africa, 1900-1950." Environmental History 4(No. 2, April 1999):245- . (v10,#4)

Philosophica, Volume 39:1 (1987). Ghent University, Belgium. This is a special issue, "probably the first philosophical journal on the European continent to devote an entire issue to environmental ethics" (p. 3). The issue contains seven articles, but three of these focus on problems with animal-rights (Tom Regan, "Pigs in Space," Evelyn Pluhar, "The Personhood View and the Argument from Marginal Cases," and Raymond G. Frey, "The Significance of Agency and Marginal Cases"). Articles by Robin Attfield, Dieter Birnbacher, Frank De Roose, and J. Baird Callicott focus on broader problems in environmental philosophy. Pickering, Andrew, "Asian Eels and Global Warming: A Posthumanist Perspective on Society and the Environment," Ethics and the Environment 10(no. 2, 2005):29-43. My idea in this essay is to talk about how some recent developments in my field--science and technology studies--might pass over into environmental studies. In particular, I want to talk about a certain posthumanist perspective on the relation between people and things, because it transfers nicely from thinking about people and machines to thinking about people and the environment. The basic point is that the academic disciplines carve up the visible world in a systematic way. On the one hand, the natural sciences, engineering, and so on, talk about a world of things from which people are notably absent. Human beings might disturb ecosystems, but the job of the ecologist is to understand the systems themselves, not the disturbances. We find a beautiful disciplinary dualism: to the harder sciences goes the world of things: to the softer sciences goes the world of people. But what about the interface of people and things, the zone of intersection? Pickering is in sociology at the University of Illinois at Urbana-Champaign. (Eth&Env)

Pierce, Christine, and Donald VanDeVeer, eds., People, Penguins, and Plastic Trees, 2nd ed. \$ 35.00. Belmont, CA: Wadsworth Publishing Co., 1995. 485 pages, paper. Here is the second edition of the best-selling text first published in 1986, widely regarded as the easiest text to use with freshmen and sophomores. Additions include: ecofeminism, deep ecology, Native American land ethics, critiques of

industrialized nations by those in less-industrialized nations, environmental racism, sustainability, as well as the continuing issues: moral relations with nonhumans, biocentric views, intrinsic value, biodiversity, animal liberation, land ethics. New authors include: James Rachels, Mark Sagoff, Gary Varner, Val Plumwood, Donald Worster, Harley Cahen, Karen Warren, Holmes Rolston, Bryan Norton, Vandana Shiva, Sara Stein, Anthony Weston. Another, higher level and more theoretical (and more expensive) anthology by the same editors is The Environmental Ethics and Policy Book. (Wadsworth alone has four texts in environmental ethics.) Both editors are in philosophy at North Carolina State University. (v5,#3)

Pierce, Jessica, Morality Play: Case Studies in Ethics. Boston: McGraw Hill, 2005. Chapter III is "Habitat and Humanity," with case studies on famine in Ethiopia, hunting, ecoterrorism, dolphin parks, sea turtles, the precautionary principle, cosmetic surgery for pets, seal hunting in Canada, and more. Pierce is at the University of Colorado, Boulder. (v.14, #4)

Pierce, Jessica, and Jameton, Andrew, The Ethics of Environmentally Responsible Health Care. Oxford University Press, 2004. The book is summarized in Jameton, Andrew, and Pierce, Jessica, "Environment and health: Sustainable health care and emerging ethical responsibilities," Canadian Medical Association Journal 164(2001):365-369. Health care professionals and organizations need to consider the long-term environmental costs of providing health care and to reduce the material and energy consumption of the health care industry. This may seem a surprising conclusion, given that average human health has, for the most part, improved in recent decades despite environmental decline. Yet, these achievements are fragile. In the long term, human health requires a healthy global ecosystem. There is no realistic way or current technology available to replace declining natural ecosystem services (e.g., climate stabilization, water purification, waste decomposition, pest control, seed dispersal, soil renewal, pollination, biodiversity and protection against solar radiation) that are essential to health. Jameton is with the Department of Preventive and Societal Medicine, University of Nebraska Medical Center, Omaha, NB. Pierce is with the Department of Philosophy, University of Colorado at Boulder, Boulder, CO. (v.14, #4)

Pierce, Jessica. Theologies for Our Time: Our Moral Relationship to the Earth, Ph.D. thesis at the University of Virginia, in the Department of Religious Studies, May 1993. Theological ethics is moving away from anthropocentrism and toward theocentrism. While the value of nonhuman life is necessarily understood from the human perspective, it does not follow that humans beings are the center or measure of all value. Ethics should be conceived primarily in the language of response and responsibility, correcting a traditional formulation in terms of principles and rules in terms of justice. This highlights community and the common good, relates parts to whole, individuals to communities, and re-describes the community and common good to include the nonhuman world. The work builds on James Gustafson's theocentric ethics, and John B. Cobb's and Jay McDaniel's process theology. James F. Childress was the principal advisor. Pierce is now Assistant Professor, Department of Preventive and Societal Medicine, University of Nebraska Medical Center, Box 984350, Omaha, NE 68196-4350. (v5,#1)

Pietarinen, Juhari, "Principal Attitudes towards Nature," in Pekka Oja and Risto Telama, eds., Sport for All (Amsterdam: Elsevier Science Publishers, 1991), the Proceedings of the World Congress of Sport for All, Tampere, Finland, June 1990. There are four attitudes: (1) Utilism aims to use nature to achieve a high level of welfare for people, nature is a huge and valuable source of energy and raw materials, people have an unlimited right to use nature for their welfare, and technology makes this possible. (2)

Humanism aims at the intellectual and moral development of humans, nature contains the possibilities for cultural development, and people have a right to use nature for promoting Socratic virtues, technology should be developed in accordance with these goals of humanism. (3) Mysticism aims at the experience of unity with nature, nature is essentially a spiritual and divine totality, a sanctity, the achievement of which is the highest end for human life, science and technology are rejected if they undermine this. (4) Naturism aims at the conservation of nature in as original and primordial condition as possible, nature is a uniform system acting in accord with the laws of ecology, and humans are part of the system, all parts of nature are of equal inherent value, which people should respect, all technology that endangers the life of other species and causes ecological disturbances should be rejected. Each of the four affects not only human work but the sports in which it is appropriate for humans to participate. Perhaps it is necessary to have proponents of all four attitudes; possibly no proper balance between people's interests and the tolerance of nature can be found. Pietarinen teaches philosophy at the University of Turku, Finland. He has developed this position in a series of papers in Finnish over twenty years and is the first philosopher systematically to develop environmental philosophy in Finland. (Finland)

Pilson, Diana, and Holly R. Prendeville, "Ecological Effects of Transgenic Crops and the Escape of Transgenes into Wild Populations," Annual Review of Ecology, Evolution, and Systematics 2004, 35:149-174. Transgenes will have more specific target effects, intended results, and may have fewer nontarget effects, unintended results. But the escape of transgenes into wild populations by hybridization and introgression could lead to increased weediness or to the invasion of new habitats by the wild population. Native species with which the wild plant interacts could be negatively affected by transgenic wild plants. The authors are in biology, University of Nebraska, Lincoln. (v.14, #4)

Pimentel, D, Brown, N., Vecchio, F., LaCapra, V., Hausman, S., Lee, O., Diaz, A., Williams, J., Cooper, S., and Newburger, E., "Ethical Issues Concerning Potential Global Climate Change on Food Production", Journal of Agricultural and Environmental Ethics 5(1992):113-146. The projected changes in climate associated with global CO₂ increases are expected to alter world food production. Burning fossil fuel in the North American continent contributes more to the CO₂ global warming problem than in any other continent. The resulting climate changes are expected to alter food production. The overall changes in temperature, moisture, carbon dioxide, insect pest, plant pathogens, and weeds associated with global warming are projected to reduce food production in all regions. The authors are in entomology at the College of Agriculture and Life Sciences at Cornell University, Ithaca, NY.

Pimentel, D., Berger, B., Filiberto, D., Newton, M., Wolfe, B., Karabinakis, E., Clark, S., Poon, E., Abbott, E. and Nandagopal, S., "Water Resources: Agricultural and Environmental Issues," BioScience 54(no. 10, 2004): 909-918(10). The increasing demands placed on the global water supply threaten biodiversity and the supply of water for food production and other vital human needs. Water shortages already exist in many regions, with more than one billion people without adequate drinking water. In addition, 90 of the infectious diseases in developing countries are transmitted from polluted water. Agriculture consumes about 70 of fresh water worldwide; for example, approximately 1000 liters (L) of water are required to produce 1 kilogram (kg) of cereal grain, and 43,000 L to produce 1 kg of beef. New water supplies are likely to result from conservation, recycling, and improved water use efficiency rather than from large development projects. (v.14, #4)

Pimentel, D; Herz, M; Glickstein, M; Zimmerman, M; Allen, R; Becker, K; Evans, J; Hussain, B; Sarsfeld, R; Grosfeld, A, "Renewable Energy: Current and Potential Issues," Bioscience 52(no.12, 2002): 1111-1120.

Pimentel, David, "Ethanol Fuels: Energy Security, Economics, and the Environment", Journal of Agricultural and Environmental Ethics 4(1991):1-13. Problems of fuel ethanol production have been the subject of numerous reports, including this analysis. The conclusions are that ethanol: does not improve U.S. energy security; is uneconomical; is not a renewable energy source; and increases environmental degradation. Ethanol production is wasteful of energy resources and does not increase energy security. Considerably more energy, much of it high-grade fossil fuels, is required to produce ethanol than is available in the energy output. About 72% more energy is used to produce a gallon of ethanol than the energy in a gallon of ethanol. Ethanol production from corn is not renewable energy. Its production uses more non-renewable fossil energy resources in growing the corn and in the fermentation/distillation process than is produced as ethanol energy. Ethanol produced from corn and other food crops is also an unreliable and therefore a non-secure source of energy, because of the likelihood of uncontrollable climatic fluctuations, particularly droughts which reduce crop yields. The expected priority for corn and other food crops would be for food and feed. Increasing ethanol production would increase degradation of agricultural land and water and pollute the environment. In U.S. corn production, soil erodes some eighteen times faster than soil is reformed, and, where irrigated, corn production mines water faster than recharge of aquifers. Increasing the cost of food and diverting human food resources to the costly and inefficient production of ethanol fuel raise major ethical questions. These occur at a time when more food is needed to meet the basic needs of a rapidly growing world population.

Pimentel, David, Westra, Laura, and Noss, Reed F., eds. Ecological Integrity. Covelo, CA: Island Press, 2000. 384 pp. Cloth \$70. Paper \$35. Since 1992 the Global Integrity Project has brought together leading scientists and thinkers to examine the combined problems of threatened and unequal human well-being, degradation of the ecosphere, and unsustainable economies. Based on the proposition that healthy ecosystems are a necessary prerequisite for both economic security and social justice, the project is built around the concept of ecological integrity and its practical implications for policy and management. Ecological Integrity presents a synthesis and findings of the project. (v.11,#4)

Pimentel, David, Pimentel, Marcia, eds. Food, Energy, & Society. Niwot, CO: University Press of Colorado, 1997. 2nd ed. Individuals and nations as they face the inevitable dilemma of how everyone can be fed, given the limits of land, water, energy, and biological resources. (v8,#2)

Pimentel, David, Shanks, Roland E., Rylander, Jason C. "Bioethics of Fish Production: Energy and the Environment," Journal of Agricultural and Environmental Ethics 9(1996):144-164. Aquatic ecosystems are vital to the structure and function of all environments on earth. Worldwide, approximately 95 million metric tons of fishery products are harvested from marine and freshwater habitats. A major problem in fisheries around the world is the bioethics of overfishing. A wide range of management techniques exists for fishery, managers and policy-makers to improve fishery production in the future. The best approach to limit overfishing is to have an effective, federally regulated fishery, based on environmental standards and fishery carrying capacity. Soon, overfishing is more likely to cause fish scarcity than fossil fuel shortages and high energy prices for fish harvesting. However, oil and other fuel shortages are projected to influence future fishery policies and the productive capacity of the fishery industry. Overall, small-scale fishing systems are more energy efficient than large-scale systems. Aquaculture is not the solution to wild fishery production. The energy input/output ratio of aquacultural fish is much higher than that of the harvest of wild populations. In addition, the energy ratios for aquaculture systems are higher than those for most livestock systems. Keywords: bioethics, fish, energy, environment, food. Pimentel, Shanks, and Rylander teach in the College of Agriculture and Life Sciences, Cornell University. (JAEE)

Pimentel, David, ed., The Pesticide Question: Environment, Economics, and Ethics. New York: Chapman and Hall, 1993. 448 pages. \$ 45, cloth. Environmental impacts of pesticide use and value tradeoffs and ethical issues. Sometimes the pesticide use is as much for cosmetic purposes as for real nutritional or health significance. (v4,#1)

Pimentel, David et al (and eight others), "Economic and Environmental Benefits of Biodiversity," BioScience 47(1997):747-757. The annual economic and environmental benefits of biodiversity in the United States total approximately \$ 319 billion. Some aspects of conserving biodiversity are expensive, although they may return major dividends. The economic value to humans around the world is \$ 2.9 trillion annually. By comparison, the gross domestic product in the U.S. topped \$ 7.6 trillion in 1996. For another study, see Costanza, Robert, and twelve others, "The Value of the World's Ecosystem Services and Natural Capital," Nature 387(15 May 1997):253-260, and note in ISEE Newsletter, v.8,#2. Costanza's group figured the world total in the range of \$ 16-54 trillion, with an average of \$ 33 trillion per year. So the numbers seem slippery, but everybody agrees they are huge. (v.8,#4)

Pimentel, David, Houser, James, White, Omar. "Water Resources: Agriculture, the Environment, and Society," Bioscience 47(no.2, 1997):97. An assessment of the status of water resources. (v8,#1)

Pimentel, David and Marcia Pimentel, eds., Food, Energy, and Society, rev. ed. Niwot, CO: University Press of Colorado, 1996. \$ 39.95. 392 pages. In the fifteen years since the first edition of this book was published, world energy supplies, especially fossil fuels, have dwindled as their use has escalated. Availability of the other major resources required for human life also has come under growing pressure.

These include fertile land, water, and biological diversity. The very integrity of these resources is threatened. David Pimentel is professor of insect ecology, Marcia Pimentel teaches nutritional science in the College of Human Ecology, Cornell University. (v7,#2)

Pimentel, David, "Environmental and Social Implications of Waste in U.S. Agriculture and Food Sectors", Journal of Agricultural Ethics 3(1990):5-20. Because the agriculture/food sectors appear to be driven by short-term economic and political forces, cheap energy, and agricultural-chemical technologies, waste and environmental/social problems in the agricultural/food sectors are estimated to cost the nation at least \$150 billion per year. Most of the waste and environmental/social problems can be eliminated through better resource management policies and the adoption of sustainable agricultural practices. Pimentel is in entomology at New York State College of Agriculture and Life Sciences, Cornell University, Ithaca.

Pimentel, David, Westra, Laura, and Noss, Reed F., eds. Ecological Integrity: Integrating Environment, Conservation, and Health. \$ 35.00 paper, \$ 70.00 hardbound. Washington, DC: Island Press, 2000. A result of the Global Integrity Project. The integrity concept. Historical and philosophical perspectives. Sustainability and the integrity of natural resource systems. Human and societal health. The economics and ethics of achieving global integrity. 21 contributions. In addition to the editors, contributors include James Karr, Robert Goodland, Orié Loucks, Mark Sagoff, Peter Miller, Ernest Partridge, Robert Ulanowicz, Donald A. Brown, Alan Holland, and others. Partridge's "Reconstructing Ecology" is a sustained critique of Mark Sagoff's deconstructing of ecology; see separate entry. Also of particular interest: Ted Schrecker, "The Cost of the Wild: International Equity and the Losses from Environmental Conservation." (v.12,#1)

Pimentel, David, "Economics and Energetics of Organic and Conventional Farming", Journal of Agricultural and Environmental Ethics 6(1993):53-60. The use of organic farming technologies has certain advantages in some situations and for certain crops such as maize; however, with other crops such as vegetables and fruits, yields under organic production may be substantially reduced compared with conventional production. In most cases, the use of organic technologies requires higher labor inputs than conventional technologies. Some major advantages of organic production are the conservation of soil and water resources and the effective recycling of livestock wastes when they are available. Pimentel is in agriculture and life sciences at Cornell University, Ithaca, NY.

Pimentel, David et al., "Water Resources: Agricultural and Environmental Issues", BioScience 54(no.10, 1 October 2004):909-918(10). The increasing demands placed on the global water supply threaten biodiversity and the supply of water for food production and other vital human needs. Water shortages already exist in many regions, with more than one billion people without adequate drinking water. In addition, 90 of the infectious diseases in developing countries are transmitted from polluted water. Agriculture consumes about 70 of fresh water worldwide; for example, approximately 1000 liters (L) of water are required to produce 1 kilogram (kg) of cereal grain, and 43,000 L to produce 1 kg of beef. New water supplies are likely to result from conservation, recycling, and improved water-use efficiency rather than from large development projects.

Pimentel, David S., and Peter H. Raven, "Bt Corn Pollen Impacts on Nontarget Lepidoptera: Assessment of Effects in Nature," Proceedings of the National Academy of Sciences 97(no. 15, July 18, 2000):8198-8199. The effect of Bt corn on butterfly populations appears to be relatively insignificant, compared with other considerations. Bt corn permits reduced use of pesticides and the use of pesticides required with non Bt corn (especially to kill the corn rootworm) has worse environmental effects. Some 35% of food sold in U.S. supermarkets has detectable pesticide residues, an undesirable effect. Pesticides cause the death of 70 million birds a year and kill billions of insects, beneficial as well as harmful, each year. The beneficial insects are vital to fruit and vegetable pollination, useful biological control agents, and many

others. Such environmental losses, due to pesticide killing of beneficial insects, are estimated at \$1 billion a year. Pimentel is in entomology, Cornell University. Raven is at the Missouri Botanical Garden, St. Louis.

Pimentel, David. "Amounts of Pesticides Reaching Target Pests: Environmental Impacts and Ethics." Journal of Agricultural and Environmental Ethics 8(1995):17-29. Less than 0.1% of pesticides applied for pest control reach their target pests. Thus, more than 99.9% of pesticides used move into the environment where they adversely affect public health and beneficial biota, and contaminate soil, water, and the atmosphere of the ecosystem. Improved pesticide application technologies can improve pesticide use efficiency and protect public health and the environment. (JAEE)

Pimentel, David; Hepperly, Paul; Hanson, James; Douds, David; Seidel, Rita, "Environmental, Energetic, and Economic Comparisons of Organic and Conventional Farming Systems," BioScience 55 (no. 7, July 2005): 573-582. Various organic technologies have been utilized for about 6000 years to make agriculture sustainable while conserving soil, water, energy, and biological resources. Among the benefits of organic technologies are higher soil organic matter and nitrogen, lower fossil energy inputs, yields similar to those of conventional systems, and conservation of soil moisture and water resources (especially advantageous under drought conditions). Conventional agriculture can be made more sustainable and ecologically sound by adopting some traditional organic farming technologies. Response by Alex Avery, "Organic and Conventional Agriculture Reconsidered," BioScience 55(2005):820-821, and see that entry.

Ping, Ye, "On the Structure of Ecological Ethics," Seeking Truth, no. 2 (1992): 39-42. Article in Chinese. The foundation, starting point, and ultimate end of ecological ethics is the coordination of the ongoing relations between humans and nature. To develop an ecological ethics, there must be development of the study of ecological moral philosophy as well as of the study of ecological science. This involves both fundamental principles and application, theory and practice; it couples attitudes and behaviors, personal norms and personal actions. Both this and the preceding article criticize an exclusively anthropocentric ethics and begin to explore a nonanthropocentric environmental ethics. Ye Ping is professor of philosophy, Northeast Forestry University, Harbin, China. (v3,#1)

Pirages, Dennis C., ed. Building Sustainable Societies: A Blueprint for a Post-Industrial World. Armonk, NY: M.E. Sharpe, 1996. 372pp. \$54.95 cloth, \$24.95 paper. This collection of articles addresses the question whether the industrial model of human progress can be sustained in the long run. It analyzes the social political, economic, and environmental implications as well as potential solutions to the problem of resource-intensive growth. (v8,#1)

Pister, Edwin P. "Endangered Species: Costs and Benefits." Environmental Ethics 1(1979):341-52. Biologists are often placed in the difficult position of defending a threatened habitat or animal with vague reasoning and faulty logic simply because they have no better rationale at their immediate disposal. This places them at a distinct disadvantage and literally at the mercy of resource exploiters and their easily assignable dollar values. Although the initial dollar cost of delaying or precluding "development" may be significant, the long-term benefits of saving the biological entities which might otherwise be destroyed are likewise great and are measurable in concrete terms which society is only now beginning to appreciate. Case histories are presented, a more profound rationale is explained, and the environmentalist is challenged to make his case sufficiently effective to reverse the current exploitive trends which threaten so many of Earth's life forms. Pister is at the California department of Fish and Game, Bishop, CA. (EE)

Pister, Edwin P. (Phil), "Desert Fishes: An Interdisciplinary Approach to Endangered Species Conservation in North America," Journal of Fish Biology (UK) 37(1990): Supplement A: 183-187. In the 1960' and 1970's, protective legislation and basic research needed for conservation efforts did not exist, and Pister recounts developing these. Desert aquatic communities were among the first to need attention, and an interdisciplinary effort was mounted in an early application of conservation biology. Pister was, until retirement, with the California Department of Fish and Game and remains secretary of the Desert Fishes Council. This whole supplement is the papers from a symposium, "The Biology and Conservation of Rare Fish," held by the Fisheries Society of the British Isles, Lancaster, U.K., July 16-20, 1990. (v5,#4)

Pister, Edwin Philip, "Species in a Bucket, Natural History, January 1993. Phil Pister's celebrated story of an emergency transfer of the Owens pupfish (Cyprinodon radiosus), an endangered species in California, from one spring to another, when he held the entire population of the species in two buckets. "For a few frightening moments, there was only myself standing between life and extinction." Pister is a retired fisheries biologist with the Desert Fishes Council, Bishop, California. (v4,#2)

Pister, Edwin P., "Ethics of Native Species Restoration: The Great Lakes," Journal of Great Lakes Research 21, Supplement 1 (1995):10-16. Value issues are of increasing importance in environmental decisions, although narrow academic backgrounds and traditional scientific rigidity among decision makers have impeded proper consideration of ethics. Aldo Leopold's land ethic and the developing discipline of environmental ethics provide a solid foundation for restoration of habitats and native fauna in the Great Lakes. Such principles provides the best chance for constructing biologically and ethically sound restoration programs. Pister is with the Desert Fishes Council, Bishop, CA. (v.10,#1)

Pitcher, Alvin, Listening to the Crying of the Earth: Cultivating Creation Communities. Cleveland: The Pilgrim Press, 1993. Paper. 157 pages. Chapter titles: What is happening to the Earth? Why our social institutions are not responding well to the ecological crisis. Theological foundations for responding. Being a part of a creation community. With appendices as case studies and summary position statements. Quite usable in local churches, for general readers. Does not deal with the major issues raised in philosophical environmental ethics. Pitcher is professor emeritus of ethics and society at the Divinity School, University of Chicago. (v5,#2)

Pleune, Ruud, "Strategies of Environmental Organizations in the Netherlands regarding the Ozone Depletion Problem," Environmental Values 5(1996):235-255. Strategies of environmental organizations in the Netherlands regarding the ozone depletion problem have been analyzed both at the cognitive level and at the operational level. The first objective of this analysis was to describe their strategies over a period of time. Secondly, it aimed to increase understanding of the linkage between cognitive and operational aspects of the strategies. The third objective was to find out to what extent strategies are constant features of an organization and how far they are defined by particular problems. The results indicate that each of the organizations concerned with the ozone depletion problem adopted several different strategies, that the strategies of the organizations did not change much over time, and that there was no one-to-one linking of different aspects of the strategy of the organizations. Strategies seem largely to be defined by the problem encountered. KEYWORDS: Strategy, ecocentrism, anthropocentrism, environmental organization, environmental movement, ozone depletion (EV)

Plotnik, Joshua M., Frans B. M. de Waal, and Diana Reiss, "Self-Recognition in an Asian Elephant," Proceedings of the National Academy of Sciences (PNAS) 103(November 7, 2006):17053-17057. Now elephants have joined a small group of animals that can recognize themselves in a mirror (apes, dolphins--

known only once). Researchers at the Bronx Zoo found that an elephant could repeatedly use her trunk to examine a white X the researchers had painted on her face in a location she could only see in the mirror. See also: Miller, Greg, "Jumbo Reflections," ScienceNOW Daily News, 30 October 2006.

Pluhar, Evelyn B., Beyond Prejudice: The Moral Significance of Human and Non-human Animals. Reviewed by Hugh Lehman. Journal of Agricultural and Environmental Ethics 9(1996):187. (JAEE)
Pluhar, Evelyn B., "When Is It Morally Acceptable to Kill Animals?", Journal of Agricultural Ethics 1(1988):211-224. In response to Professor Lehman's arguments on "the rights view", I distinguish two versions of the rights view: the "equal" and the "unequal" rights view. I conclude with a discussion of the merits of phasing out the meat production industry. Pluhar is in philosophy at Penn State University-Fayette, Uniontown.

Pluhar, Evelyn B. Review of Regulation, Values and the Public Interest. Edited by K. M. Sayre et al. Environmental Ethics 6(1984):271-74.

Pluhar, Evelyn, "Who Can be Morally Obligated to be a Vegetarian?" Journal of Agricultural and Environmental Ethics 5(1992):189-216. I argue that Tom Regan's "liberty principle" either contradicts his "equal rights view" or does not permit the slaughter of another for food. I show that a different view recognizing the moral rights of nonhumans but according them less value than normal adult humans, "the unequal rights view", would permit such action if human survival or health depended upon it. Finally, I argue that current nutritional research does not support George's contention that most humans would suffer if they ceased eating other animals and their products. Pluhar is in philosophy at Pennsylvania State University Fayette Campus, Uniontown.

Pluhar, Evelyn B., Beyond Prejudice: The Moral Significance of Human and Nonhuman Animals. Durham, NC: Duke University Press, 1995. \$ 19.95 paper. 392 pages. (v6,#4)

Pluhar, Evelyn, "Vegetarianism, Morality, and Science Revisited", Journal of Agricultural and Environmental Ethics 7(1994):77-82. Professor Kathryn George's "Use and Abuse Revisited" does not contain an accurate assessment of my "On Vegetarianism, Morality and Science: A Counter Reply." I show that she has misrepresented my moral and empirical argumentation. Pluhar is in philosophy at Pennsylvania State University, Fayette Campus, Uniontown.

Pluhar, Evelyn, Review of Lehman, Hugh, Rationality and Ethics in Agriculture. Journal of Agricultural and Environmental Ethics 9(1996):181-186. (JAEE)

Pluhar, Evelyn B., "On Vegetarianism, Morality, and Science: A Counter Reply", Journal of Agricultural and Environmental Ethics 6(1993):185-213. I recently took issue with Kathryn George's contention that vegetarianism cannot be a moral obligation for most human beings. In her 1992 response to my critique, George did not address my moral argumentation. In my counter-reply, I argue that her rejection of my discussion of nutrition is based upon numerous distortions, omissions, and false charges of fallacy. As I did in my earlier paper, I cite current research, including George's own preferred source on the topic of vegetarianism, to support my view. Pluhar is in philosophy at Pennsylvania State University, Fayette Campus.

Pluhar, Evelyn B. "The Justification of an Environmental Ethic." Environmental Ethics 5(1983):47-61. Tom Regan has made a very important contribution to the debate on environmental ethics in his "On the

Nature and Possibility of an Environmental Ethic." The debate can be brought out yet more clearly by contrasting Regan's views with those of an eminent critic of environmental ethics in Regan's sense, William K. Frankena. I argue that Regan's position has much to recommend it, but has a fatal flaw which would render environmental ethics unjustifiable. I suggest this flaw can be remedied by divorcing an environmental ethic from a dubious ontological commitment. Reflection on metaethics, ontological commitments, and the nature of ethical justification leads to a conclusion favorable to an environmental ethic. Pluhar is in the philosophy department, Pennsylvania State University, Fayette Campus, Uniontown, PA. (EE)

Pluhar, Evelyn, Beyond Prejudice: The Moral Significance of Human and Nonhuman Animals. Reviewed by Tom Regan. Journal of Agricultural and Environmental Ethics 10(1997):79-82. (JAEE)

Pluhar, Evelyn B., Beyond Prejudice: The Moral Significance of Human and Nonhuman Animals. Durham, NC: Duke University Press, 1995. 370 pages. Paper, \$ 19.95. Any sentient cognitive being--one caring about what happens to him or herself--is morally significant, supporting the moral status and rights of many nonhuman animals. Implications of this for children and abnormal humans, and its relevance for population policies, animal testing, euthanasia, hunting and the treatment of companion animals. Pluhar is in philosophy at Pennsylvania State University, Fayette Campus, Uniontown. (v7,#1)

Pluhar, Evelyn B., "The Justification of an Environmental Ethic," Environmental Ethics 5(1983):47-61. An important discussion of the metaethical foundations of an environmental ethic, particularly the nonnaturalistic individualism of Tom Regan. Pluhar reminds us that substantive environmental ethics can take place only against a background of deep metaethical problems. The search for "intrinsic value" in natural ethics may well be a fruitless task. (Katz, Bibl # 1)

Pluhar, Evelyn, "Is There a Moral Relevant Difference Between Human and Animal Nonpersons?", Journal of Agricultural Ethics 1(1981):59-68. It is commonly believed that we humans are justified in exploiting animals because we are "higher" beings: persons who have highly complex, autonomous lives as moral agents. I conclude that, although there is a morally relevant difference between human nonpersons and most animal nonpersons, this difference is not an indication of superior moral status. We would do better to abandon speciesism and the assumption that personhood is morally paramount for a view which implies that both human and nonhuman nonpersons are morally considerable and have a right to life. Pluhar is in philosophy at Pennsylvania State University, Fayette Campus.

Pluhar, Evelyn B., "Two Conceptions of An Environmental Ethic and Their Implications." Ethics and Animals Vol. 4, no. 4 (December 1983): 110-127. An analysis of the problems and strengths of both holism and individualism. Pluhar attempts to blend the two positions, emphasizing the importance of individual rights and interests, but also considering the aesthetic features of nonsentient individuals and systems to be morally valuable. But this leaves unclear why we should preserve ugly species and ecosystems. (Katz, Bibl # 1)

Pluhar, Evelyn, "Utilitarian Killing, Replacement, and Rights", Journal of Agricultural Ethics 3(1990):147-171. The ethical theory underlying much of our treatment of animals in agriculture and research is the moral agency view. It is assumed that only moral agents, or persons, are worthy of maximal moral significance, and that farm and laboratory animals are not moral agents. I consider a number of ingenious recent attempts by utilitarians to defeat the killing and replaceability arguments, including the attempt to make a place for genuine moral rights within a utilitarian framework. Those who reject the restrictive moral agency view and find they cannot accept utilitarianism's unsavory implications must look to a different ethical theory to guide their treatment of humans and non-humans. Pluhar is in philosophy at Penn State University, Fayette Campus, Uniontown.

Plumb, Jessica. "Patagonia's Rugged Beauty Has Its Share of Chills and Thrills." *Christian Science Monitor* 89 (17 July 1997): 10, 12. Includes details of how to get there via plane, bus, or boat. (v8,#3)

Plumwood, Val, "Intentional Recognition and Reductive Rationality," *Environmental Values* 7(1998): 397-421. Recognition of intentionality and the possibility of agency in nonhuman others is a prerequisite for a process of mutual adjustment and dialogue that could replace current reductive and dualistic human-centered theories. John Andrews' article in this issue of *Environmental Values* is criticised for misattributing to me the view that intentionality could be a sole criterion for moral worth - a view which I reject as unacceptably hierarchical and human-centered. To clarify my position, the values and limitations of different kinds of ranking are discussed; and the concept of intentionality is explored, with particular reference to apparently purposeful machines and to Dennett's theory of consciousness. KEYWORDS: consciousness, dualism, moral extensionism, intentionality, panpsychism, ranking, reductionism. Val Plumwood resides at Braidwood, NSW, Australia. (EV)

Plumwood, Val, "Babe: The Tale of the Speaking Meat," *Animal Issues* 1(1997):1-20. "The problems in representing other species' communicative powers or subjectivities in terms of human speech are real, but they do not rule out such representation in any general way, and they pale before the difficulties of failing to represent them at all, or before the enormity of representing communicative and intentional beings as lacking all communicative and mental capacity ... (which is) a much greater inaccuracy and injustice than any anthropomorphism could be" (p. 1). (v.11,#1)

Plumwood, Val, "Feminism and Ecofeminism: Beyond the Dualistic Assumptions of Women, Men and Nature," *The Ecologist* 22(no. 1, January/February 1992):8-13. The identification of men with culture and women with nature has been fiercely criticized by feminists who have shown how it is used to justify the domination of both women and nature. While liberal feminists have challenged the feminine ideal, and radical feminists have promoted the replacement of patriarchal values with feminine ones, a thoroughgoing ecofeminism should question the construction of both masculine and feminine identities. The article contains a box summary: "Current Trends in Ecofeminism. Among these current trends (a position not shared by Plumwood), "Cultural ecofeminism emphasizes the quest for a new spiritual relationship to nature, and stresses personal transformation and the (re)empowerment of women and women's values. Women are seen as having a superior relationship with nature which is sometimes taken to be biologically determined, so that only a society in which women can limit or control the number and influence of men will be free of aggressiveness and the destruction of nature." A good short article for sorting out the different kinds of ecofeminism. Plumwood lectures at the Department of General Philosophy, University of Sydney, Australia. (v5,#2)

Plumwood, Val, "Women, Humanity and Nature." *Radical Philosophy* 48 (Spring 1988): 16-24. Excellent argument for the importance of the ecofeminist investigation into the connections between the domination of women and the domination of nature. Plumwood seeks to address the "naive" feminist view that consideration of a female-nature connection is a regressive move re-emphasizing the traditional categories of female subjugation to male instrumental rationality. She argues for the necessity of re-structuring a new degendered model of human nature that transcends the old categories of masculine and feminine; we do not want to be left with a model of human nature based on a naive female "closeness to nature" which denies "reason, intelligence and control of life conditions" (p. 23). Instead we ought to see the connection between what is human and what is natural. (Katz, Bibl # 2)

Plumwood, Val, "Babe: The Tale of the Speaking Meat," *Animal Issues* 1(1997):1-20. "The problems in representing other species' communicative powers or subjectivities in terms of human speech are real, but

they do not rule out such representation in any general way, and they pale before the difficulties of failing to represent them at all, or before the enormity of representing communicative and intentional beings as lacking all communicative and mental capacity ... (which is) a much greater inaccuracy and injustice than any anthropomorphism could be" (p. 1). (v10,#4)

Plumwood, Val, "Ecofeminism an Overview and Discussion of Positions and Arguments", Australasian Journal of Philosophy, Supplement to 64 (1986)", 120-38. There are a number of striking initial parallels between the treatment of women and that of nature, so that the investigation of conceptual links between these kinds of domination seems a logical outcome of the growth of both the environmental and feminist movements. The author claims, however, that an exploration of the conceptual links between the domination of women and that of nature reveals many serious difficulties. The author provides a critical outline of the positions in the literature and suggests ways to salvage from ecofeminism a position which sheds valuable light on the conceptual structure of domination, and makes important critical points about the western philosophical tradition.

Plumwood, Val, Feminism and the Mastery of Nature. New York: Routledge, 1994. 248 pages. Paper. \$ 17.95. The master form of rationality in Western culture has been systematically unable to acknowledge dependency on nature. Feminist thought can contribute to radical green thought and to the development of a better environmental philosophy. Some chapter titles: Feminism and Ecofeminism; Dualism: the Logic of Colonisation; Mechanism and Mind/Nature Dualism; Ethics and the Instrumentalising Self; Deep Ecology and the Denial of Difference, Changing the Master Story. Says Nancy Fraser (Northwestern University), "Puncturing the myth of 'the angel in the ecosystem,' Plumwood aims to develop a genuinely critical ecological feminism." Plumwood teaches in the Department of Philosophy at the University of Tasmania, Australia. (v5,#1)

Plumwood, Val, "Prospecting for Ecological Gold Amongst the Platonic Forms: a Response to Timothy Mahoney," Ethics and the Environment 2(1997):149-168. Timothy Mahoney discovers and champions an ecologically benign account of Plato in opposition to my own critical analysis of the reason-centeredness, reason-nature dualism, and nature and body devaluation in the Platonic dialogues, in which multiple linked dualism of reason and nature associated with systems of oppression provide major organizing principles for Platonic philosophy. I show first that Mahoney's criticisms of my interpretation involve some careless and mistaken readings of my own text. Second, I argue that Mahoney's account of nature is significantly different from Plato's, and that his interpretation of Plato is an overly generous and idealized one which plays on the multiplicity and elasticity of the concept of nature and the notorious vagueness of the concept of participation to conflate, among other things, Plato's attitude to celestial nature with his attitude to biological nature. Mahoney's interpretation involves setting aside the issue of Plato's most offensive and revealing passages of earth disparagement, ignoring the network of social meanings from which Plato's philosophy emerges. Finally, I give some reasons why Mahoney's accounts of participation and nature, even considered as a reworking of Plato, would be highly problematic as the foundation for an ecological philosophy. Plumwood is currently a visiting professor at the University of Montana. (E&E)

Plumwood, Val, "Plato and the Bush", Meanjin, 49 (1990): 524-36. How does philosophy in Australia treat the issue of how humans can or should relate to the natural world? The question is particularly interesting in the light of current interest in the environment, and because of the presence in this country of two cultures, Aboriginal and white, which contrast markedly on the issue of relations to the land. The author discusses the two Australian philosophical traditions and the conflict between them, by focusing on two figures, one historical and one contemporary. Plato's philosophy of nature, the basic elements of which are followed by a succession of rationalist philosophers, is contrasted to first-hand statements of Aboriginal relationship to the land. These first-hand accounts, it is claimed, must replace accounts of Aboriginal views obtained through the filter of white anthropologists. What emerges is a worldview in which, first, there is a constant interchange of forms between human and non-human spheres. Second, obligations concerning the land are central to social, moral and religious life. Third, human social identity and individual identity are intimately connected to the land. A critical scrutiny of our own past philosophical traditions together with a dialogue with Aboriginal worldviews promises to open some new perspectives, and to enable better recognition of some of the wisdom of those who inhabited the land for so long before us, whose record of care contrasts so remarkably with our own.

Plumwood, Val, "Androcentrism and Anthrocentrism: Parallels and Politics," Ethics and the Environment 1(no. 2, 1996):119-152. The critique of anthrocentrism has been one of the major tasks of ecophilosophy, whose characteristic general thesis has been that our frameworks of morality and rationality must be challenged to include consideration of nonhumans. But the core of anthrocentrism is embattled and its relationship to practical environmental activism is problematic. I shall argue here that although the criticisms that have been made of the core concept have some justice, the primary problem is not the framework challenge or the core concept itself, but rather certain problematic understandings of it which have developed in environmental philosophy. In the case of the intrinsic/instrumental distinction, much of the criticism turns on unrealistic expectations about what the distinction means and what it can do; in the case of anthropocentrism, a perverse reading which I will call cosmic anthrocentrism has invited many of the criticisms which have been widely seen as fatal to the concept. Using concepts and models originating in feminist theory and other liberation critiques, I outline an alternative, feminist rereading of anthrocentrism. I argue that this model is theoretically illuminating and capable of meeting major objections that the perverse readings have invited. Critics of the core distinctions have almost universally identified the two core concepts and issues of anthrocentrism and instrumental/intrinsic value. The analysis I present will show how these concepts and issues are connected, but also why there is more to anthrocentrism than the failure to recognise the intrinsic value of nature, and why anthrocentrism rather than intrinsic value should be the major conceptual focus of environmental critique. It will also show why the framework challenge is of practical importance to the green movement and why anthrocentrism is a serious problem in contemporary life. Plumwood lives in Australia where (according to the contributor's notice) she is a forest dweller, bushwalker, and crocodile survivor. (E&E)

Plumwood, Val, Environmental Culture. New York: Routledge, 2002. Rather than looking at the symptoms of environmental degradation to find out what has gone wrong in our thinking, Plumwood looks at the roots of our thinking. She argues that we need to move away from the isolated, individualistic and liberal conception we have of our place in nature and see humanity as part of our ecological world-view, not standing outside it.

A detailed and passionate argument for forms of culture that are logically and pragmatically superior to those cultures built on rationalism, idealism, empiricism, and other philosophical systems that encourage moral distance. Plumwood's focus is on the ways common Western philosophical and practical conceptions of knowledge, goodness, and existence have ignored the grand and absolute significance of the natural world and have therefore brought us to the brink of global ecological disaster.

The ecological crises we currently face are the result of arrogant cultures, based in arrogant philosophical views, that deny the fact that humans are dependent on nature, men dependent on women, and those with economic and decision-making power are dependent on the disempowerment of others.

Instead of thinking of the project of ethics as a matter of extending the boundaries of human-centered thought and recognizing the value of others in relation to human worth, Plumwood suggests that we begin with basic respect for all life and approach others with an ethos of intentional recognition and openness. Plumwood, Val, "The Concept of a Cultural Landscape: Nature, Culture and Agency in the Land," Ethics and the Environment 11(2006):115-150. The Millennium Ecosystem Assessment Report issued in April 2005 shows how severely our civilisation is degrading and overstressing the natural systems that support human life and all other lives on earth. An important critical challenge, especially for the eco-humanities, is to help us understand the conceptual frameworks and systems that disappear the crucial support provided by natural systems and prevent us from seeing nature as a field of agency. This paper considers the currently popular concept of a cultural landscape as an example of a concept that downplays natural agency, and discusses the epistemology of nature scepticism and nature cynicism that often accompanies its vogue in the humanities. Can some philosophical disentangling of senses of nature (often considered the most complex term in the language) allow sceptics their main points without placing them on such a strong collision course with the requirements of commonsense and survival? Plumwood is at the Centre for Resource and Environmental Studies, Australian National University, Canberra. (Eth&Env)

Plumwood, Val, "Tasteless: Towards a Food-Based Approach to Death," *Environmental Values* 17(2008):323-330. In this posthumously published paper Val Plumwood reflects on two personal encounters with death, being seized as prey by a crocodile and burying her son in a country cemetery with a flourishing botanic community. She challenges the exceptionalism which sets the human self apart from nature and which is reflected in the choice between two conceptions of death, one of continuity in the

realm of spirit, the other a reductive materialist conception in which death marks the end of the story of the self. Both perspectives structure out the basis of animal existence - that we are all food, and through death nourish others. She commends an animistic materialist approach, where life is seen as in circulation and where mortuary practices might affirm death as an opportunity of life for others in the ecological community.

"Human Vulnerability and the Experience of Being Prey." *Quadrant*, March 1995, pp. 29-34. *Quadrant* is an Australian literary and academic magazine (46 George St., Fitzroy, Victoria 3065, a Melbourne suburb, ISSN 033-5002. Also published as "Being Prey," *Terra Nova* 1 (no. 3, Summer 1996):32-44. Reflections on her attack by a crocodile in Kakadu National Park, Australia, on February 5,

1985. Plumwood was attacked while canoeing, and rolled three times as the crocodile attempted to drown her. She reached a steep, muddy bank with a paperbark tree with low branches, and made several efforts to escape. "As I leapt again into the same branch, the crocodile again propelled itself from the water, seizing me once more, this time round the upper left thigh." Escaping at great ordeal, she later reflects, "The human species has evolved not only as predator, but also as prey, and this has very likely given us capacities to scent danger which we cannot now recognise or account for." She contrasts aboriginal and colonial attitudes toward nature, masculine bias in extensive media coverage of her attack, and reflects over the conquest of nature and human vulnerability. "The illusion of invulnerability is typical of the mind of the colonizer; and as the experience of being prey is eliminated from the face of the earth, along with it goes something it has to teach about the power and resistance of nature and the delusions of human arrogance. In my work as a philosopher, I now tend to stress our failure to perceive human vulnerability, the delusions of our view of ourselves as rational masters of a malleable nature."

Plumwood, Val. "Integrating Ethical Frameworks for Animals, Humans, and Nature: A Critical Feminist Eco-Socialist Analysis." Ethics and the Environment 5(2000):285-322. ABSTRACT: I discuss in this article ways a critical feminist-socialist ecology envisage the projects of animal ethics and defense in a form both might begin to be both more integrated and more effective as a liberatory theory and political movement than the present offerings of animalist theories. Mainstream (mainly male and abstract) animal ethics theory has many substantial achievements to its credit. It has effectively contested the dominant human-centered assumption that ethics, mind, and communicative capacity are confined to the human sphere, and begun to drive mainstream philosophy towards a revision of Cartesian human/nature dualism. Some ecofeminist and eco-socialist theorists especially have developed a powerful critique of human/animal dualisms and their role in rendering food practices as well as science practices sites for both human and gender domination. Plumwood, Val. "Ethics and Instrumentalism: A Response to Janna Thompson." Environmental Ethics 13(1991):139-149. I argue that Janna Thompson's critique of environmental ethics misrepresents the work of certain proponents of non-instrumental value theory and overlooks the ways in which intrinsic values have been related to valuers and their preferences. Some of the difficulties raised for environmental ethics (e.g., individuation) are real but would only be fatal if environmental ethics could not be supplemented by a wider environmental philosophy and practice. The proper context and motivation for the development of non-instrumental theories is not that of an objectivist value theory but rejection of the human domination and chauvinism involved in even the broadest instrumental accounts of nature as spiritual resource. Plumwood is in the philosophy department, University of Sydney, Sydney, Australia. (EE)

The EU often has higher environmental standards than the US, and when Europe moves ahead the U.S. sometimes must follow, reluctantly or not in exports to Europe. The EU is now the pacemaker in showing what is possible, especially in phasing out toxics, which American industry may complain they can't afford to eliminate. U.S. industry may lobby in Brussels against the tighter standards. (v.14, #4)

Pohl, Sarah. "Technology and the Wilderness Experience." Environmental Ethics 28(2006):147-163. Environmental Ethics 28(2006):147-183. As mechanical devices become lighter, sleeker, and cheaper, the issue of technology in wilderness becomes an increasingly more important ethical concern because many high-tech luxuries or devices stand to separate the backcountry traveler from the very goals he or she hopes to actualize by recreating in wilderness. As recreationists, we need to determine which items are essential and which are distracting, separating important "equipment" from needless "devices," and exercising the self-control to carry only what we need. This process can be called "responsible simplicity." It is in the backcountry traveler's best interest to exercise responsible simplicity, to choose only the devices necessary to actualize the telos, or goal, of one's wilderness experience. A critique of the appropriateness of technology in the backcountry should entail examining devices in their context and also by their relationship to other technologies brought into the backcountry. From a virtue ethics standpoint, responsible simplicity can promote the integrity of wilderness recreation by providing oversight with regard to what goods are internal to the practice. It can also allow room for "wilderness" in our everyday lives in association with David Strong's notion of "counterbalancing" and Albert Borgmann's notions of "eloquent reality" and "focal practices." This volume results from the First International Conference on Ethics and Environmental Policies, held in Borca di Cadore, Italy, in 1990. The second such conference was just held at the University of Georgia in April, see above. The main sponsoring foundation is Fondazione Lanza, via Dante 55, 35139 Padova, Italy. Phone 049/8756788. Contents (translations from the Italian), Gabrielle Scimemi, "Ethics in Environmental Policy: An International Perspective"; Franz Böckle, "Environmental Ethics: Philosophical and Theological Foundations"; Antonia Autiero, "A Hope for Our Planet"; Frederick Ferre, "The Environment and the Problem of Evil"; Warwick Fox, "Anthropocentric and Nonanthropocentric Foundations of Environmental Decision-Making"; Sebastiano Maffettone, "Ethics in Environmental Policy"; Kristin Shrader-Frechette, "Ethics in Environmental Policy: Public Action and Populist Reforms"; Corrado Poli, "Environmental Impact Assessment and Value Judgments: Foundations for New Techniques"; Barbara Rhode, "Environmental Damage and the Application of Criminal Law"; Kenneth E. Boulding, "Environmental Ethics and Earth's Economic Systems"; Charles Howe, Ethics, Environment, and Economic Practice"; Peter Brown, "Fiduciary Responsibility and the Greenhouse Effect"; Ratna Murdia, "Environmental Impact and Deforestation in India"; Carlos B. Gutierrez, "Ethics, Politics, and Economics applied to a Safari in Amazonia"; Thomas Heyd, "Sustainable Development: Panacea or Impossibility? Some Implications for Implementing Ethics." An English translation of this work is in progress. (v3,#1)

Policy Implications of Greenhouse Warming (Washington: National Academy Press, 1991). A report by the Committee on Science, Engineering, and Public Policy of the National Academies of Science and Engineering and the Institute of Medicine. The United States could cut emissions of greenhouse gases by 10% to 40% for little or no cost. Meanwhile ozone destruction worsens. New satellite data show that the ozone shield over the United States is eroding twice as fast as had been assumed. See Science, April 12, 1991. (v2,#1)

Polishchuk, Leonard V., "Conservation Priorities for Russian Mammals," Science 297(16 August 2002):1123. Conservation of slow-reproducing, long-lived, large-bodied species is especially challenging and especially in Russia, for example with the Siberian tiger and the polar bear. But Russian resources for conservation, though directed at the tiger and bear, are overlooking over species such as the desman (a cat-sized mole-like animal, much trapped for its fur), on the endangered species list. Polishchuk is in ecology, M. V. Lomonosov Moscow State University, Moscow. (v.13,#4)

Polk, Danne, "Good Infinity/Bad Infinity: Il y a, Apeiron, and Environmental Ethics in the Philosophy of Levinas," Philosophy in the Contemporary World 7(no. 1, Spring):35-40. Although Levinas does not specifically articulate an environmental ethic, he certainly has a concept of nature, from which can be drawn the human, primordial relationship to the elemental. This involves two types of infinity, environmental imperatives toward both the body's exclusive relationship to nature and to the interpersonal relationships between the self and other human beings. Apeiron is undifferentiated material nature. Polk is in philosophy, Villanova University. (v.11,#3)

Polk, Danne W., "Gabriel Marcel's Kinship to Ecophilosophy" Environmental Ethics 16(1994):173-186. Gabriel Marcel spent most of his life developing a phenomenology of human intersubjectivity. While doing so he discovered the extent to which an authentic human community depends upon the relationship it has to nonhuman nature. By exploring Marcel's critique of technology, as well as his religious phenomenology, I show the proximity to which Marcel's philosophy approaches the current egalitarian response of the radical ecology movement. Even though the bulk of Marcel's work is concerned with

human intersubjectivity, his writings advocate a transcendence of anthropocentrism to what Marcel calls "cosmocentrism," an existential attitude toward the world which submits to the sacredness of all beings, as well as to the bioregions within which all earthly creatures share the sacraments of life. Polk is in philosophy, Villanova University, Villanova, PA. (EE)

Pollack, Andrew, "Genes from Engineered Grass Spread for Miles, Study Finds," New York Times, September 21, 2004, P. A1, C4. Genes from genetically engineered grass can spread much farther than previously known, up to 13 miles in windblown pollen. Monsanto and Scotts have developed a strain of creeping bentgrass for use on golf courses that is resistant to the widely used herbicide Roundup. The altered grasses would allow groundkeepers to spray the herbicide in their greens and fairways, while leaving the grass unscathed. But environmental groups and the U.S. Forest Service and Bureau of Land Management worry that the grass would spread to areas where it is not wanted or transfer its herbicide resistance to weedy relatives, creating superweeds immune to the weedkiller. The Forest Service has said that the grass "has the potential to adversely impact all 175 national forests and grasslands." (v.14, #4)

Pollack, Andrew, "U.S. and Allies Block Treaty On Genetically Altered Goods," New York Times (2/25/99): A1. U.S. blocks international treaty on trade in genetically altered goods. The U.S., Canada, Australia, Chile, Argentina and Uruguay blocked a Biosafety Protocol supported by 130 nations that would have required exporters of genetically-altered organisms and seeds to get explicit permission from importing nations. The treaty was aimed at preventing possible environmental harm from such trade. The six major agricultural exporters objected to the inclusion of commodities like wheat and corn, arguing that they are meant for eating and processing and do not enter the environment. They were afraid that the protocol would be used as an excuse to block billions of dollars in farm exports. From 25 to 45 percent of corn, cotton and soybeans grown in the U.S. has been genetically modified. The Biosafety Protocol was an outgrowth of the Convention on Biological Diversity agreed to at the 1992 Rio de Janeiro Earth Summit. The U.S. Senate has still not ratified this convention because of fear it would harm the biotechnology industries. (v.10,#1)

Pollack, Andrew, "Biotech's Sparse Harvest," New York Times, February 14, 2006. Genetically engineered crops have mostly benefited farmers by making it easier for them to control weeds and insects, but the promise of healthier and tastier foods is still unfulfilled. Big companies are not interested in it, for fear of customer resistance. Smaller companies do not have the resources to do it. Where some results have been achieved, there are often problems; it's more nutritious, but it doesn't taste good, or there are side effects. Corn with more lysine, an amino acid, is being fed to farm animals. Considerable work has been done with soybeans to change the fat composition to more desirable fats, with mixed success. Often traditional breeding works about as well, without customer resistance.

Pollack, Andrew, "Can Biotech Crops Be Good Neighbors?" New York Times, September 26, 2004. The answer is quite uncertain. (v.14, #4)

Pollan, Michael, Second Nature: A Gardener's Education. New York: Atlantic Monthly Press, 1991. There are two problems with a purist ethic toward nature. (1) Seemingly pristine parts of nature are more changed by humans already than we like to realize. (2) There is no guidance for what to do with areas that are not pristine. "'All or nothing,' says the wilderness ethic, and in fact we've ended up with a landscape in America that conforms to that injunction remarkably well. Thanks to exactly this kind of either/or thinking, Americans have done an admirable job of drawing lines around certain sacred areas (we did invent the wilderness area) and a terrible job of managing the rest of our land. The reason is not hard to find: the only environmental ethic we have has nothing useful to say about those areas outside this line. Once a landscape is no longer 'virgin' it is typically written off as fallen, lost to nature, irredeemable. We hand it over to the jurisdiction of that other sacrosanct American ethic: laissez-faire economics. ... Essentially, we have divided our country in two, between the kingdom of wilderness,

which rules about eight percent of America's land, and the kingdom of the market, which rules the rest" (p. 188-189). (v7,#1)

Pollan, Michael, "Only Man's Presence Can Save Nature," Journal of Forestry 88(no.7, July, 1990):24-33. A panel with Daniel B. Botkin, Dave Foreman, James Lovelock, Frederick Turner, and Robert D. Yaro. The theme is the shifting definitions of nature and of humans. Some opinions: "We are foolish to believe that all our problems are solvable, especially by technology or sociology." "The quintessential element of nature [is] us. Humankind is more what nature is than anything else." "The Indians changed the ecology of North America totally." "We shouldn't treat nature as if it's a machine--take it apart, rebuild it, and substitute new parts. The rule should be: change nature at nature's rates and in nature's ways." Michael Pollan is executive editor of Harper's Magazine, in which this earlier appeared. And he ought to have better sense than to use a sexist title like this. Maybe his environmentalist opinions are suspect on this account alone. (v3,#3)

Pollan, Michael , *The Omnivore's Dilemma: The Search for a Perfect Meal in a Fast-Food World* (London: Bloomsbury, 2006). Reviewed by Michael Allen Fox, *Environmental Values* 17(2008):113-116.

Pollan, Michael. *The Omnivore's Dilemma: A Natural History of Four Meals*. New York: Penguin Press, 2006. The "American paradox" is that we are a "notably unhealthy people obsessed by the idea of eating healthily." Pollan eats four meals, following the origins and results of the food eaten. One is from an Iowa farm with confined animal feeding operation. One is a meal from an organic supermarket. One is on a small farm in Virginia run by a farmer who creatively exploits natural symbioses of plants and animals. The last is in the hunter-gatherer food chain. In closing he reflects on "the perfect meal," with a true accounting of its benefits and costs.

Population and Environment is an interdisciplinary journal. A special issue on "Roots of Environmental Neglect" is forthcoming. Articles feature the comparative importance of population, affluence, depletion of natural resources, new technologies, ideology, ethics, social domination, anthropocentrism, biocentrism. The journal especially publishes articles that seek to integrate and reconcile these viewpoints, or to enrich this debate by grounding it in such disciplines as history, philosophy, political science, psychology, anthropology, economics, biology, literature, and archeology. (v8,#1)

Population and Environment, an interdisciplinary journal, is soliciting contributions for a forthcoming special issue on "Roots of Environmental Neglect." Reviews of prevailing viewpoints (e.g., the comparative importance of population, affluence, depletion of natural resources, new technologies, ideology, ethics, social domination, anthropocentrism, biocentrism) are welcome. Equally welcome are contributions which seek to integrate and reconcile these viewpoints, or which seek to enrich this debate by grounding it in such disciplines as history, philosophy, political science, psychology, anthropology, economics, biology, literature, and archeology. Please send papers, in duplicate, to Dr. Moti Nissani, Guest Co-Editor, Interdisciplinary, Studies Program, 5700 Cass Ave., Wayne State University, Detroit, MI 48202, USA; Email: mnissani@juno.com; Fax: (313) 577-8585; Tel.: (810) 543-0536 (home & message). (v8,#2)

Population and Environment: A Journal of Interdisciplinary Studies is now in volume 13, an important journal that may be overlooked by those interested in environmental ethics. The editor is Virginia Abernethy, Department of Psychiatry, AA-2206 Medical Center North, Nashville, TN 37232. Phone: 615/322-6608. The publisher is Human Sciences Press, Inc., 233 Spring Street, New York, NY 10013-

1578. Phone 212/620-8000. A free sample copy is available. A sample paper, by Virginia Abernethy is: "The True Face of Compassion: Immigration Policy and Other Ways to Help." "The steadily intensifying national debate on immigration is incorrectly cast with pro-immigration 'humanitarians' on the one hand and hard-nosed, tight-border, 'America-firsters' on the other. This scenario distorts an underlying question, which is how to encourage and support third world countries in confronting their own, very serious problems. From this perspective, positions both for and against high immigration share the common ground of having a compassionate intent." "Immigration policy is one of the very few means by which the U. S. may be able to influence the trend of world population growth. ... Barriers to immigration which lead to zero population growth in the U.S. make us a credible international example. ... Only then will the most innovative, even dissident, people beyond our border be persuaded to remain at home, where they are needed to confront and lead the way out of the misery which inevitable results from failure to recognize limits." (Thanks to Ron Engel.) (v4,#1)

Porritt, J, "Sustainability without Spirituality: a Contradiction in Terms?," Conservation Biology 16(no.6, 2002): 1465.

Porritt, Jonathon, "The Common Heritage: What Heritage? Common to Whom?" Environmental Values Vol.1 No.3(1992):257-268. ABSTRACT: Global commons are natural goods which transcend national boundaries. A brief glance at management of oceans and terrestrial commons is succeeded by fuller discussion of rainforests, over which nations claim property rights, yet which perform global services. Leasing out could effect a desirable transfer of funds from North to South. Sustainable development requires these or other large incentives towards environmental protection in developing countries, but land and institutional reform are crucial to success. In conclusion, the anthropocentric ethic implicit in all such solutions is contrasted with the ecocentric one which may be necessary to preserve the biosphere in the future. KEYWORDS: Biosphere, global commons, rainforests, property rights, stewardship, sustainability. 30 Swinton Street, London WC1X 9NX, UK.

How value disputes have found their way into the policymaking process, pitting the values of science, technology, economics, and environmental conservation against the practice of politics. Portney is at Tufts University. (v4,#3)

Portney, Paul R., and Weyant, John P., eds., Discounting and Intergenerational Equity. Washington, DC: Resources for the Future, 1999. 224 pages. \$ 33 hardback. The contributor economists generally embrace discounting for evaluating projects with timeframes of forty years or less, with the discount rate to reflect the opportunity costs of capital. But beyond the forty year mark, much discomfort sets in. Very large costs to the future are worth nothing today. In fact, using the 7 percent discount rate that the Office of Management and Budget recommends for such purposes, the present inhabitants of Earth should not spend more than \$ 2 each today to prevent the loss of the entire gross domestic product (GDP) of the whole world two hundred years from now. Several contributors doubt that standard cost-benefit analysis is useful at all for problems with significant intergenerational consequences. A major problem is climate change; the usual discounting warrants spending rather little today to prevent great losses to future persons. Portney is president of Resources for the Future; Weyant is in engineering-economic systems at Stanford University. (v.10,#3)

Posewitz, Jim, Beyond Fair Chase: The Ethic and Tradition of Hunting. Helena, MT: Falcon Press, 1994. Paper. \$ 5.95. Cloth, \$ 17.95. "As hunters we enjoy the rare privilege of participating in the natural process rather than only observing it from a distance. We become, for a time a predator like the human hunters of our distant origins. We are however, a minority; and if we are to continue, we must do it in a way that is acceptable to the majority." "You need to be familiar with the field, the woods, the marsh, the forest, or the mountains where you hunt. If you work hard and long at this aspect of hunting, you can become a part of the place you hunt. You will sense when you start to belong to the country. Go afield often enough and stay out long enough and it will happen. Little by little you will become less of an intruder. More animals will seem to show themselves to you. You are no longer a stranger in their world; you have become part of it. Many people hunt for a lifetime without learning this, and they miss the most rewarding part of being a hunter." Already over 100,000 copies of this book have been used in hunter education programs in thirty states. Posewitz is a longtime Montana conservationist, and founder of Orion, The Hunters Institute. (v5,#4)

Posey, D., Balee, W., eds. Resource Management in Amazonia. Bronx, NY: The New York Botanical Garden, 1989. 304pp. \$59 paper. Examines the resource-use practices of eight tribal groups as well as the caboclos, non-tribal rural farmers, fisherman, and foragers in Amazonia, the world's largest expanse of tropical rain forest. In a variety of habitats--flood-plain and upland forests, savannas, highlands, black and clear water rivers--these peoples have developed management practices that can provide new insights for the conservation and wise use of these threatened ecosystems.

Posey, Darrell A., ed., Cultural and Spiritual Values of Biodiversity: A Complementary Contribution to the Global Biodiversity Assessment. London: Intermediate Technologies, and Nairobi, UNEP (United Nations Environment Programme), 1999. A hefty volume of 731 large-format, double-column pages. Some thirty contributors include David Suzuki, Baird Callicott, James Nash, Mark Sagoff, Oren Lyons, Vandana Shiva, and Rosemary Radford Ruether, as well as first-hand testimonies from representatives of indigenous groups around the world. Posey is at the Department de Ciências Biológicas, Universidad Federal do Maranhao, Sao Luis, Maranhao, Brazil. (v.11,#3)

Posner, Richard, Catastrophe. New York: Oxford University Press, 2004. The odds of the occurrence of one or more catastrophes are growing quickly because of "the breakneck pace of scientific and technological advance." These possible catastrophes include rapid climate change, which "is to a significant degree a byproduct of the success of capitalism in enormously increasing the amount of world economic activity ... and is a great and growing threat to anyone's idea of human welfare." About this, conservatives are "in a state of denial." Posner is often known for his economic approach to making decisions but, unfortunately, catastrophe "turns out to be an unruly subject for economic analysis." Posner is a judge of the U.S. Court of Appeals for the Seventh Circuit.

Post, James A., "Managing As If the Earth Mattered," Business Horizons 34, no. 4 (1991): 32-38. Managers can no longer ignore environmental problems; they must manage as if the earth mattered, because in fact it does. (v4,#2)

Pottast, Thomas, "Inventing Biodiversity: Genetics, Evolution, and Environmental Ethics," Biologisches Zentralblatt (now Theory in Biosciences/Theorie in den Biowissenschaften) 115(nos. 2/3, 1996):177-188. In English. A historical survey of the concept of biodiversity. There are two components: genetic diversity, arising from the study of cultivated plants, and species diversity, arising from the study of evolutionary history. The first person to combine these was Otto Herzfeld Frankel, Australian plant geneticist and breeding scientist, in 1970 and again in 1974, using the term "evolutionary responsibility," his precursor to the later term "environmental ethics." Biodiversity conservation includes both economic dimensions and natural history dimensions, both with implications for nature conservation. (Presumably Frankel features genetic biodiversity conservation, else there was already Leopold, Carson, Muir, active in environmental ethics.) Pottast is at the Center for Ethics in the Sciences and the Humanities, University of Tübingen, Germany. (v.10,#1)

Potter, Van Rensselaer, "Fragmented Ethics and 'Bridge Bioethics'," Hastings Center Report 29(no. 1, 1999):38-40. Environmental ethics can be a bridge between the two cultures: the sciences and the humanities. An environmental ethic seeks the preservation and restoration of the natural landscape, plants, and animals; clean air; plentiful, nonpolluted water; and large areas in the wild state. It can serve as a bridge between pluralist interests in society, and bridge humans to nature, also serve as a bridge to the future. Potter is professor emeritus in oncology at the University of Wisconsin. (v.10,#1)

Potter, Van Rensselaer, "Evolving Ethical Concepts," BioScience 27(1977):251-253. Analyses the origins of environmental ethics in the 1970's, and earlier precedents, finding Rolston a key figure, in contrast to Hardin.

Potter, Van Rensselaer, Global Bioethics: Building on the Leopold Legacy. Michigan State University Press, 1989. Reviewed in Environmental Ethics 11(1989):281-85.

Potter, Van Rensselaer, Discussion section: "Real Bioethics: Biocentric or Anthropocentric?," Ethics and the Environment 1(no.2, 1996):177-183. Environmental ethics is done by philosophers operating within the strict canons of the discipline. Environmental ethics has been pursued as the traditional ethics of pure reason. Real bioethics is not pure, traditional, reasoning ethics. Real bioethics is done by realistic scientists and concerned biologists and physicians who have an intuition to help build a "Bridge to the Future" whether or not their effort is labeled "bioethics." Among this cohort is Physicians for Social Responsibility and the editors of their new journal, Medicine and Global Survival. These people are not professional ethicists. As realists they see the survival and well-being of the human species as a matter of organizational morality--a civic society directed to the "common good" world-wide, as soon as possible, and with a long-range perspective. Real bioethics is not merely biocentric or merely anthropocentric. Instead, real bioethics calls for an idealistic mix of biocentrism and the kind of humanism that is concerned with the needs, interests, and welfare of human beings, or, in other words, and enlightened or realistic anthropocentrism that acknowledges the central role of the biosphere in the continued existence and "common good" of the human species, as previously discussed in connection with global bioethics, a subject foreign to environmental ethicists. From any point of view, real bioethics falls in the context of the ideals of two Wisconsin professors who lived in the early part of the twentieth century, Aldo Leopold and Max Otto. Potter was, until retirement, professor of oncology at the McArdle Laboratory for Cancer Research at the University of Wisconsin. He claims to have coined the word "bioethics" in 1970. (E&E)

Pouteau, Sylvie, "The Food Debate: Ethical Versus Substantial Equivalence," Journal of Agricultural and Environmental Ethics 15(no. 3, 2002):291-303. Substantial equivalence (SE) has been introduced to assess novel foods, including genetically modified (GM) food, by means of comparison with traditional food. Besides a number of objections concerning its scientific validity for risk assessment, the main difficulty with SE is that it implies that food can be qualified on a purely substantial basis. SE embodies the assumption that only reductive scientific arguments are legitimate for decision-making in public policy due to the emphasis on legal issues. However, the surge of the food debate clearly shows that this technocratic model is not accepted anymore. Food is more than physico-chemical substance and encompasses values such as quality and ethics. These values are legitimate in their own right and require that new democratic processes are set up for transverse, transdisciplinary assessment in partnership with society. The notion of equivalence can provide a reference scale in which to examine the various legitimate factors involved: substance (SE), quality (Qualitative Equivalence: QE), and ethics (Ethical Equivalence: EE). QE requires that new qualitative methods of evaluation that are not based on reductive principles are developed. EE can provide a basis for the development of an Ethical Assurance as a counterpart of Quality Assurance in the food sector. In France, a second circle of expertise is being set up to address the social issues in food public policy beside classical risk assessment by the first circle of expertise. Since ethics is likely to become an organizing principle of the second circle, the equivalence ethical framework can prove instrumental in this context. KEY WORDS: equivalence ethical framework, "Ethical Assurance," second circle of expertise, food integrity, genetically modified (GM) food, legitimate factors, quality, substantial equivalence.

Povilitis, Anthony J. "On Assigning Rights to Animals and Nature." Environmental Ethics 2(1980):67-71. Watson argues that living entities do not have intrinsic or primary rights, such as the right to existence, unless they are capable of fulfilling reciprocal duties in a self-conscious manner. I suggest that (1) Watson's "reciprocity framework" for rights and duties is excessively anthropocentric, (2) that it is founded on the incorrect-assumption that the Golden Rule refers to mutual rather than individual duties, and (3) that Watson arbitrarily equates moral rights with primary rights. Since "intrinsic" rights are, in effect, assigned rights, the assignment of rights to a given entity is viewed as a function of its perceived value. Thus, in emphasizing differences between man and other living entities, Watson chooses Cartesian values in assigning rights. Conversely, the ecological and evolutionary relatedness of living things forms the basis for considering rights within the naturalist tradition. Povilitis is a senior wildlife ecologist for VTN Wyoming, Sheridan, WY. (EE)

Pratt, Dallas. Alternatives to Pain in Experiments on Animals. Reviewed in Environmental Ethics 4(1982):273-79.

Pratt, Scott L., "The given land: Black Hawk's conception of place," Philosophy and Geography 4 (No. 1, 2001): 109-125. In the wake of a war against the United States and the displacement of his people from

their lands at the confluence of the Rock and Mississippi Rivers, the Sauk leader, Black Hawk, prepared an autobiography published in 1833. At the center of his work was an attempt to offer his readers a strategy that would make it possible for the Sauk and other Native peoples to coexist with the Americans of European descent who had come to the Mississippi valley. The autobiography, from this perspective, represents more than another statement of a Native American "worldview." Instead, it offers an assessment and a response to a crisis of survival. At issue for Black Hawk are neither property rights nor the troubles of communication between cultures, but rather ways of seeing and understanding the place that sustained the life of his people. Here, the land is not merely something valued, but rather the ground that organizes the meaning of things and events. It is the breakdown of this logic of place, both within the Native community and outside it that precipitated the disastrous war and it is the recovery of this logic through the narrative of Black Hawk's autobiography that he raises the possibility of cultural survival. This paper reexamines Black Hawk's project and provides resources for reading it both as philosophy and as an instance of a conception of place that can contribute to ongoing efforts to promote the coexistence of cultural differences in the land of Black Hawk's people. Pratt is Assistant Professor of Philosophy at the University of Oregon. (P&G)

Pratt, Vernon, with Howarth, Jane, and Brady, Emily, Environment and Philosophy. London and New York: Routledge, 2000. 275 pages. £ 14.00 An introduction to environmental ethics, concentrating on the philosophical presuppositions, and making these accessible those outside philosophy, especially to those in environmental science. Two great structures of modern Western civilization are particularly questioned: individualism and science. Chapters: 1. Introduction. 2. Objective nature. Science. 3. We are all one life. Romanticism, reaction to science, ending in deep ecology. 4. The exploitation of nature and women. Ecofeminism. 5. Phenomenology and the environment (by Jane Howarth). 6. Preston, Christopher J. "Epistemology and Intrinsic Values: Norton and Callicott's Critiques of Rolston." Environmental Ethics 20(1998):409-28. Debates over the existence of intrinsic value have long been central to professional environmental ethics. Holmes Rolston, III's version of intrinsic value is, perhaps, the most well known. Recently, powerful critiques leveled by Bryan G. Norton and J. Baird Callicott have suggested that there is an epistemological problem with Rolston's account. In this paper, I argue first that the debates over intrinsic value are as pertinent now as they have ever been. I then explain the objections that Norton and Callicott have raised against Rolston's position. In the main body of the paper, I attempt to show that Rolston's position can accommodate these objections. In this defense of Rolston's position, I have two goals: first, to show that the notion of non-subjective intrinsic value in nature is coherent, and second, to illuminate the places where further philosophical work on intrinsic value remains to be done. Preston is in philosophy at the University of Montana, Missoula. (EE)

Preston, Christopher, Grounding Knowledge: Environmental Philosophy, Epistemology, and Place. Athens: University of Georgia, 2003. An exploration of what Paul Shepard once called "the strange and necessary relationship between place and mind." The author gathers evidence from science studies, cognitive science, evolutionary biology, ecological psychology, anthropology, religious studies, and narrative experience for the claim that physical environments play a structuring role in the knowledge claims that we make. The result is a broad and philosophically informed account of what is often referred

to as "a sense of place." Once the connection between place and mind has been made, Preston makes a straightforward case for the epistemic significance of place, arguing that places (and natural environments in particular) should be valued as important epistemic and cognitive sources. Preston is in philosophy, University of South Carolina.

Preston, Christopher J. "Conversing with Nature in a Postmodern Epistemological Framework." Environmental Ethics 22(2000):227-240. In a recent contribution to this journal, Jim Cheney argues for a postmodern epistemological framework that supports a conception of inquiry as a kind of "conversation" with nature. I examine how Cheney arrives at this metaphor and consider why it might be an appealing one for environmental philosophers. I note how, in the absence of an animistic account of nature, this metaphor turns out to be problematic. A closer examination of the postmodern insights that Cheney employs reveals that it is possible to stress the agency of nature in epistemology without having to draw on the metaphor of conversation. I conclude that this alternative account is not only more plausible, but can probably do the same ethical work as the problematic metaphor of inquiry as conversation. (EE)

Preston, Christopher J., Reintegration with Nature: Against Dualist Metaphysics. Colorado State University Master's thesis. Completed fall 1992. Cartesian metaphysics separates humans from nature; both environmental philosophy and environmental science (especially Barbara McClintock) offer possibilities for metaphysical reintegration with nature. Preston, Christopher J. and Steven H. Corey. "Public Health and Environmentalism: Adding Garbage to the History of Environmental Ethics." Environmental Ethics 27 (2005):3-21. There exists in the United States a popular account of the historical roots of environmental philosophy which is worth noting not simply as a matter of historical interest, but also as a source book for some of the key ideas that lend shape to contemporary North American environmental philosophy. However, this folk wisdom about the historical beginnings of North American environmental thinking is incomplete. The wilderness-based history commonly used by environmental philosophers should be supplemented with the neglected story of garbage and sanitation in North American urban areas during the nineteenth century. This supplemented history changes the conceptual territory over which North American environmental philosophy roams. This new territory is better suited to a number of important local and international environmental challenges. (EE)

Preston, Christopher J., and Wayne Ouderkirk, eds., Nature, Value, Duty: Life on Earth with Holmes Rolston, III. Dordrecht, The Netherlands: Springer, 2006. Publisher's Description: "Gifford Lecturer and Templeton Prize winner Holmes Rolston, III is widely known as the father of environmental ethics.

From his authorship of one of the first articles in professional environmental philosophy ("Is There an Ecological Ethic?" 1975) to his most recent article on the place of humanity in the cosmos ("Generating Life on Earth: Five Looming Questions" 2007) no author has taken a more prominent role in mapping out the terrain in environmental philosophy. His writings range between natural philosophy and theology and include detailed presentations of an interlocking position that includes aesthetics, value theory, natural resource policy, wilderness advocacy, and sustainable development." Nature Value and Duty: Life on Earth with Holmes Rolston, III is a collection of contemporary writings on the work of Holmes Rolston, III. The authors contributing to this volume are a mixture of senior scholars in environmental ethics and new voices in philosophy and in literature. Together they provide an in depth evaluation of many of the topics discussed by Rolston. They probe the strengths and weaknesses of his work and suggest valuable correctives. Rolston himself, in a detailed reply to each of his critics at the end of the volume, reveals where some of these criticisms sting him the most and in the process provides one of the most detailed and articulate defenses of his position ever offered."

Preston, Christopher J., "Animality and Morality: Human Reason as an Animal Activity," Environmental Values 11(2002):427-442. Those in animal and environmental ethics wishing to extend moral considerability beyond the human community have at some point all had to counter the claim that it is reason that makes human distinct. Detailed arguments against the significance of reason have been rare due to the lack of any good empirical accounts of what reason actually is. Contemporary studies of the embodied mind are now able to fill this gap and show why reason is a poor choice for a criterion to distinguish us from non-human animals. I use studies of the embodied mind to show that rationality is integrally connected to our animal and animate nature and hence not a significant point of departure between human and non-human animals. (EV)

Preston, Christopher J., *Saving Creation: Nature and Faith in the Life of Holmes Rolston, III*. San Antonio, TX: Trinity University Press, 2009. Preston documents the evolution of Rolston's theology of nature and concern for saving creation from his childhood in the Shenandoah Valley of Virginia through his four decades at Colorado State University, where Rolston gained an international reputation as the

"father of environmental ethics." The biography starts with Rolston's being dismissed as pastor of a Southwest Virginia church for being "too wild," and ends with Rolston's giving the Gifford Lectures at Edinburgh and receiving the Templeton Prize in Religion from Prince Philip in Buckingham Palace. Preston is in the Philosophy Department, University of Montana. More detail at : <http://lamar.colostate.edu/~rolston/Preston.htm>

Preston, Christopher J., "Synthetic Biology: Drawing a Line in Darwin's Sand," *Environmental Values* 17(2008):23-39. Maintaining the coherence of the distinction between nature and artefact has long been central to environmental thinking. By building genomes from scratch out of 'bio-bricks', synthetic biology promises to create biotic artefacts markedly different from anything created thus far in biotechnology. These new biotic artefacts depart from a core principle of Darwinian natural selection - descent through modification - leaving them with no causal connection to historical evolutionary processes. This departure from the core principle of Darwinism presents a challenge to the normative foundation of a number of leading positions in environmental ethics. As a result, environmental ethicists with a commitment to the normative significance of the historical evolutionary process may see synthetic biology as a moral 'line in the sand'.

Preston, Christopher. "Intrinsic Value and Care: Making Connections through Ecological Narratives," *Environmental Values* 10(2001):243-264. Vitriolic debates between supporters of the intrinsic value and the care approaches to environmental ethics make it sound as though these two sides share no common ground. Yet ecofeminist Jim Cheney holds up Holmes Rolston's work as a paragon of feminist sensibility. I explore where Cheney gets this idea from and try to root out some potential connections between intrinsic value and care approaches. The common ground is explored through Alasdair MacIntyre's articulation of a narrative ethics and the development of the notion of an ecological and evolutionary tradition. Keywords: care, intrinsic value, narrativity, tradition, ecology and evolution. Christopher J. Preston is in the Department of Philosophy, University of South Carolina, Columbia, S.C. (EV)

Preston, Guy, "Integrated Environmental Management: Will It Be Worth Having," *Africa - Environment and Wildlife* 1 (no. 1, May-June 1993):31-35. Environmental management in South Africa is coming to have much of the force of law, and this is desirable. It aims to insure that negative impacts of development proposals are minimized and positive aspects enhanced, in such a way that the social costs of development proposals, those borne by society, rather than the developer, be outweighed by the social benefits. In fact, integrated environmental management is often ineffectual because it is watered-down by interest groups; in result developers make a lot of money at considerable costs of environmental degradation that have to be borne by the community. There is far too great an emphasis on development rights and scant regard for development responsibilities. In one case (Hout Bay), poor policy planning resulted in 95% of the planning bill being footed by taxpayers. Preston is head of research in the Environmental Evaluation Unit at the University of Cape Town. (v6,#3)

Preston, Guy and Helen Rees, "Now is the Time: Confronting South Africa's Population Growth," *Africa - Environment and Wildlife* 2(no.6, November/December 1994):27-32. In South Africa, population policy has been an almost taboo subject: highly politicized, manipulated, and, many would say, functionally ignored by previous governments. The urgent need for a sound policy has to be squarely faced--with South Africa's current population set to double within the next 30 years. There is no time for dithering if the country is to shake off its past and emerge with hope and optimism for a new era. In Africa, the whole continent, it is projected that the 1990 population of about 642 million people will increase by 2050 to 3,090 million, an increase of 500%. Preston is an environmental scientist at the

University of Cape Town; Rees is a medical practitioner and chair of the South African Planned Parenthood Association. (v6,#3)

Preston, Richard, The Hot Zone. New York: Random House, 1994. 300 pp. \$ 23.00. Claims that there is great danger to human life from viruses and other diseases that are native to tropical forests, and which serve a typical ecological role in those ecosystems, but which, when spreading to humans in cities, can play havoc and bring death. The HIV virus, originally in green monkeys in Central Africa, is an example. Another is the Marburg strain of the Ebola virus, detected in Marburg, Germany in 1967 in a shipment of monkeys, and which is highly lethal in humans. This book was first serialized in The New Yorker. (v5,#4)

Pretty, Jules, "Social Capital and the Collective Management of Resources," Science 302(12 December 2003):1912-1924. "The term social capital captures the idea that social bonds and norms are important for people and communities. ... Four features are important: relations of trust; reciprocity and exchange, common rules, norms, and sanctions, and connectedness in networks and groups." Local communities have often shown in the past that with high social capital people can co-operate for collective management of resources. Since the early 1990's some 400,000 to 500,000 local groups have been established, typically with 20-30 active members. Sometimes local groups are divisive and degrade their environments, but with high social capital they do not. Pretty also dislikes "the wilderness myth," the idea that some ecosystems are relatively pristine and ought to be preserved as such, without locals managing them for their use. (The author does not address the pressures of global capitalism on such local groups; also one wonders why the need for re-naming community trust and cooperation with the economist's term "capital.") Pretty is in biology, University of Essex, UK.

Part III is on "The Value of Biological Diversity, and Chapter 10 is on "The Ethical Value of Biological Diversity." Primack is professor of biology at Boston University, an authority on rare plants in Massachusetts and on the ecology of tree communities in Malaysia. He is the book review editor for Conservation Biology. (v4,#3)

Primack, Richard, and Cafaro, Philip, "Environmental Ethics," Encyclopedia of Biodiversity 2: 545-555. Ethics is the branch of philosophy that seeks knowledge of human flourishing and right conduct toward others, so that we may act upon it. Modern philosophers have tended to limit their ethical concern to human beings, but throughout history people have also attempted to cultivate proper relationships to nature. Recently philosophers have turned to this topic, largely in response to environmental degradation and the loss of biodiversity, and have created a new discipline: environmental ethics. Environmental ethicists attempt to specify appropriate human relationships to the nonhuman, natural world. In the course of their work they have developed strong ethical arguments for preserving biodiversity. They have also challenged conventional views of happiness and human welfare and the materialistic values at the base of much modern life. While environmental ethics treats the full range of environmental issues, from air pollution to nuclear risk assessment, this article focuses on ethical issues directly related to the preservation of biodiversity. Princen, Thomas, The Logic of Sufficiency. Cambridge, MA: The MIT Press, 2005. We need to learn how to change people's behavior and formulate a changed-consumption world. This leads to a principle of "consumption sufficiency" that can reach beyond the goal of resource efficiency. Includes an analysis of "efficiency" as well as "sufficiency." The Pacific Lumber Company in California could have logged redwoods in perpetuity with a model of sufficiency, but adverse discount rates and other institutional deficiencies won out over sustainable profits tomorrow. By contrast a lobster fishery in Maine, with co-management shared by local lobstermen and state authority has surmounted the problems of common-property rights and has produced a sustainable lobster industry. Princen is in sociology, University of

Michigan.

Princen, Thomas, Maniates, Michael, and Conca, Ken, eds., Confronting Consumerism. Cambridge, MA: MIT Press, 2002. 14 chapters, ten authors. Spending efficiency, responsible shopping, consumer sovereignty ("the consumer knows best"), consumption externalities both environmental and social, ecotechnologies, quality of life/quantity of livelihood, the economics of happiness. Many authors are deliberately provocative, though none propose a no-growth economy. Consumption is an issue not only in rich countries, but in developing and transition countries. In developing nations there are over a billion people with enough income to enjoy an affluent lifestyle. Their aggregate purchasing power (as measured in local terms) already matches that of the United States. China alone will soon exert an environmental impact to rival that of the United States. Pringle, R. M., "The Origins of the Nile Perch in Lake Victoria," Bioscience 55(no.9, September 2005): 780-788. The ways in which economic, social, and political forces lead to species introductions are an important, if overlooked, aspect of ecology and conservation. The nonnative Nile perch (*Lates niloticus*) in Lake Victoria, and the ecological changes associated with the species' establishment and expansion there, has elicited tremendous attention from biologists. Yet it has never been clear why, when, or by whom the fish was introduced. Here I outline the history of fishery research and management in East Africa and explore the circumstances that led to the introduction of the Nile perch. The evidence suggests that repeated secretive introductions were made in the mid 1950s by members of the Uganda Game and Fisheries Department as part of a bifurcated effort to improve sport fishing on the one hand and to bolster fisheries on the other. Fisheries scientists affiliated with the East African Fisheries Research Organization opposed the introduction, but were ineffective; I suggest that this failure stemmed partially from their inability to engage effectively with political processes.

Prins, Gwyn, ed., Threats Without Enemies: Facing Environmental Insecurity. London: Earthscan, 1993. £ 12.95. 197 pages. We seem unable to comprehend and take relevant action to protect environmental security; the threats, though massive and ominous, are too incremental, insidious, and associated with the good things of life. There is no enemy, against which we can organize. Contributions from Prince Charles, Crispin Tickell, Jessica Tuchman Mathews, Jeremy Leggett, Kevin Gray, and others. Prior, Michael, "Economic Valuation and Environmental Values," Environmental Values 7(1998): 423-441. The origins of both economic and philosophical value theory are examined and shown to be closely related. The status of neo-classical value theory is that it is internally flawed in any attempt to describe the real world. Cost-benefit analysis as it applies to the valuation of environmental agents relies upon the claim that this neo-classical theory has a particular status in optimal welfare maximisation and, therefore, suffers the same problems of internal consistency. Economic valuation of the environment is

not a scientific process derived from external law but a social process relying upon social agreement. Alternatives to economic valuation are considered and may possess a more plausible social base. However, all environmental valuation is at odds with beliefs based upon the existence of objective and intrinsic values. KEYWORDS: Economics, axiology, values, cost-benefit analysis, environmental assessment. Michael Prior resides at Hebden Bridge, West Yorkshire, UK. (EV)

Pritchard, Greg R., Econstruction: The Nature/Culture Opposition in Texts about Whales and Whaling, 2004, Ph.D. thesis, Faculty of Arts, Deakin University, Geelong, Victoria, Australia. 422 pages. This thesis investigates the perceived opposition between "culture" and "nature", presented as a dominant, biased and antagonistic relationship, engrained in the language of Western culture. By focusing on whale texts (including older narratives, whaling books, novels and other whale-related texts), it explores the portrayal of whales and the natural world. And, lastly, it suggests that Schopenhauerian thought, which has affinities in Moby-Dick, offers a cogent approach to ecocritically reading literature. The advisor was Brian Edwards. (v.14, #4)

Pritchard, Michael S., and Wade L. Robinson. "Justice and the Treatment of Animals: A Critique of Rawls." Environmental Ethics 3(1981):55-61. Although the participants in the initial situation of justice in John Rawls' Theory of Justice choose principles of justice only, their choices have implications for other moral concerns. The only check on the self-interest of the participants is that there be unanimous acceptance of the principles. But, since animals are not participants it is possible that principles will be adopted which conflict with what Rawls calls "duties of compassion and humanity" toward animals. This is a consequence of the initial situation's assumption that principles of justice can be determined independently of other moral considerations. We question this assumption, and show that satisfactory modifications of Rawls' initial situation undermine its contractarian basis and require the rejection of exclusively self-interested participants. Pritchard and Robinson are at the department of Philosophy, Western Michigan University, Kalamazoo, MI. (EE)

Proctor, James D., "Geography, Paradox and Environmental Ethics," Progress in Human Geography 22 (no. 2, 1998):234-255. As a diverse and divided discipline, geography embodies tensions central to the paradoxical nature of human dwelling on earth, from which questions of environmental ethics arise. This article reviews major ontological and epistemological tensions within geography--that between nature and culture, and objectivism and subjectivism--emphasizing the ways in which common resolutions to these tensions often represent flawed strategies of avoiding paradox. It then connects these tensions to important philosophical dimensions of environmental ethics. I argue that normative environmental ethics must be built on an adequate sensitivity to the nature/culture tension, and that environmental meta-ethics--specifically, the problem of relativism as applied to environmental discourse--must be similarly informed by the object/subject tension. The most fundamental contribution geography can make, therefore, lies in

establishing a philosophical space for environmental ethics that takes paradox seriously and avoids its simplistic resolutions. Proctor is in geography, University of California, Santa Barbara. (v.13,#2)

Proctor, JD and Larson, BMH, "Ecology, Complexity, and Metaphor," BioScience 55 (no. 12, December 2005): 1065-1068. Complexity has recently risen to prominence in ecology as part of a broader interest that suggests its status is something more than just a scientific theory or property of reality. It may be helpful to consider complexity, and related terms such as "self organization," as recent metaphors deployed to advance knowledge on fundamental questions in ecology, including the relationship between parts and wholes, and between order and disorder. Though not commonly viewed as such, metaphors are an indispensable component of science, and should not be appraised as true or false, but rather in terms of how they help or hinder knowledge. By understanding metaphor as a necessary ally and not a threat to ecological knowledge, we may enrich our contextual understanding of complexity while continuing to invoke it in useful ways. The special section introduced by this article features essays by two prominent experts in ecology, complexity, and metaphor: science studies -- scholar Evelyn Fox Keller and theoretical ecologist Simon Levin.

(With commentary from "Animal Cognition: Bring Me My Spear" by Richard W. Byrne, *Current Biology* Vol. 17, no. 5 (2007): R164-65.) Researchers in Senegal recently spotted wild chimpanzees biting the tips of sticks, which the chimps then used like spears to jab small primates called bushbabies. There are 22 such observations, though only once was a bushbaby actually killed, and critics wonder if perhaps the chimps were not more probing around than hunting with spears. But the researchers are convinced they used spears to hunt. Bushbabies are nocturnal and hide in holes in trees in the day. Chimps do regularly hunt mammals with their hands and teeth. See also the brief story: "Spear-Wielding Chimps Seen Hunting Bush Babies" by Ann Giddons," *Science* Vol. 315, no. 5815 (23 February 2007): 1063.

Prugh, Thomas, with Robert Costanza, John H. Cumberland, Herman Daly, Robert Goodland, and Richard B. Norgaard, Natural Capital and Human Economic Survival. Sunderland, MA: Sinauer Associates, 1995. Sustainability is threatened by nothing so much as a shortage of natural capital. The global ecosystem, which provides a vast array of indispensable resources and services to human beings, can be seen as a form of capital that can never be replaced by any combination of human labor, wealth, and technology. Yet Earth's natural capital endowment is under severe strains from rapidly increasing human economic activity and population. One step toward sustainability would be to "get the prices right" by properly valuing natural capital (which might add, for instance, \$ 51,000 to the price of an automobile!). (v6,#4)

Purser, Ronald E., Park, Changkil, and Montuori, "Limits to Anthropocentrism: Toward an Ecocentric Organization Paradigm?" Academy of Management Review 20(1995):1053-1089. Historical anthropocentrism requires a linear perspective, a camera theory of knowledge, and human-nature dualism. These ideas are reproduced in organizational science and management practice. We now need an ecocentric approach, and here an environmental management paradigm is contrasted with an ecocentric responsibility paradigm. Corporate environmentalism and so-called "greening-business" are based in the environmental management paradigm, and incommensurable with the ecocentric responsibility paradigm. Out of the latter could grow an ecocentric organizational paradigm. Purser is in Organization Development, Loyola University, Chicago. Park is in Organization Behavior, Case Western Reserve University. Montuori is in Systems Science, Saybrook Institute and College of Notre Dame, San Francisco. (v.10,#1)

Putman, Daniel. "Tragedy and Nonhumans." Environmental Ethics 11(1989):345-53. The concept of tragedy has been central to much of human history; yet, twentieth century philosophers have done little to analyze what tragedy means outside of the theater. Utilizing a framework from MacIntyre's After Virtue, I first discuss what tragedy is for human beings and some of its ethical implications. Then I analyze how we use the concept with regard to nonhumans. Although the typical application of the concept to animals is thoroughly anthropocentric, I argue first that the concept of tragedy can be applied directly to nonhumans (a) because the loss of potential for some nonhumans may be as great or greater than loss of potential for some humans to whom the concept applies and (b) because tragedy depends on what is valued and, for those creatures that do not conceptualize death, the destruction of the present moment through pain and suffering is the ultimate loss, and second that self-awareness in the human sense is not necessary for tragedy. Putman is in the philosophy department, University of Wisconsin Center-Fox Valley, Menasha, WI. (EE)

Putnam, Hilary, The Collapse of the Fact/Value Dichotomy and Other Essays. Cambridge, MA: Harvard University Press, 2002. The fact/value dichotomy has found an all-too-prominent place in popular culture and philosophical thought, the idea that while factual claims can be rationally established or refuted, claims about value are wholly subjective, not capable of being rationally argued for or against. Although it is on occasion important and useful to distinguish between factual claims and value judgments, the distinction becomes positively harmful when identified with a dichotomy between the objective and the purely "subjective." Putnam is in philosophy, Harvard University.

Pyle, Robert Michael, The Thunder Tree: Lessons from an Urban Wildland. Boston: Houghton Mifflin, 1993. When people connect with nature, they do so in a specific place; roots in the earth can be as important as roots in a family. For Bob Pyle, that place was the High Line Canal in Colorado. As a boy in the 1950's he discovered it, largely a wasteland, an accidental wilderness on the edge of a growing city. As he grew up, the canal became his sanctuary, his teacher, the place where he developed a passion for the natural world. The title comes from a cottonwood tree that saved his life in a freak hailstorm. By showing how the course of a life can be changed by a piece of land, Pyle argues that if we fail to preserve our opportunities to explore nature, we will diminish human lives and human culture immeasurably. Pyle's Wintergreen won the John Burrough's Medal for the best natural history book of 1987. He is an ecologist in Gray's River, Washington, and an expert on butterflies. (v6,#4)

Pyne, SJ, "Review of: J. Donald Hughes, An Environmental History of the World: Humankind's Changing Role in the Community of Life", Environmental History 8(no.2, 2003):316.--Rappole, JH; King, DI; Rivera, JHV, "Coffee and Conservation" Conservation Biology 17(no.1, 2003):334-336.

Pyne, Stephen J., Fire in America: A Cultural History of Wildland and Rural Fire. Princeton, NJ: Princeton University Press, 1982. Pyne argues that most of America was so highly managed by Indians with fires that they set that we cannot now meaningfully recover what the forest was like without humans.

Pyne, Stephen J., "The Fires This Time, and Next," Science 294(2 November 2001):1005-1006. Fire belongs on landscapes, especially in the American West. A new problem is the enormous impact of industrial combustion. One could say there are two kinds of fires: burning fossil biomass and burning

living biomass. Fire suppression in American history has been not only by putting out fires but by driving out native Americans, who set many fires. A new problem is fires on quasi-wild lands, urban/wild interface fires, with many persons now inhabiting fire-prone forests. Humans need to be active fire managers on their landscapes.

"It is strange that we have so little sense of how to incorporate ourselves in this scene as active agents. We have, after all, enjoyed a species monopoly over fire over the entire course of human existence, and our myths almost universally attribute to fire our Faustian rise to ecological ascendancy. Yet we are peculiarly self-effacing when confronted with the challenge to reclaim our role as keepers of the flame. We should get over it." Pyne is a fire historian at Arizona State University. (v.12,#4)

Pyne, Stephen J, How the Canyon Became Grand: A Short History. New York: Viking, 1998. The social construction of the Grand Canyon. Pyne depicts "another Canyon, the one that most visitors actually see, a cultural Canyon, the Grand Canyon as a place with meaning. This landscape has been shaped by ideas, words, images, and experiences. Instead of faults, rivers, and mass wasting, the processes at work involved geopolitical upheavals and the swell of empires, the flow of art, literature, science, and philosophy, the chisel of mind against matter. These determined the shape of Canyon meaning. ... Here a great civilization encountered a great natural phenomenon. Neither was the same afterward. ... [The Canyon] has meaning, and that meaning depends less on the scene's physical geography than on the ideas through which it can be viewed and imagined. Those ideas ... have actively shaped the Canyon's meaning, without which it could hardly exist as a cultural spectacle. The Grand Canyon was not so much revealed as created" (pp. xii-xiii). Pyne is an environmental historian at Arizona State University, best known for his works on the history of fire.

Fortunately, there are other accounts of the natural history of the canyon, revealing its geological creation over millennia before its social creation in the last century, though environmental historians will no doubt soon be at work on the social construction of that natural history too, including the Vishnu schist and the river that runs through it.

Quammen, David, "Dirge for a Butterfly," Outside 19 (no. 11, November 1994):39-42 & ff. But maybe the Uncompahgre fritillary isn't as dead as it seems. The butterfly, endemic to two Colorado mountains, is thought by some scientists to be going extinct naturally, and they argue that we should then do nothing to save it (see Newsletter v.5, #1). The butterfly, which prefers wet, north-facing slopes at 13,000 feet, is

a larvae for two years, an adult only for a week, when it is disinclined to colonize new areas. Its habitat is drying out, and there is habitat further north to which it presumably might be moved. Meanwhile, the most recent work on the butterfly, by Amy Seidl of Colorado State University, finds that numbers have somewhat rebounded, possibly because pressures from sheep and collectors have been removed. (v5,#4)

Quammen, David, "Planet of Weeds," Harper's 297(no. 1781, October 1998):57-69. Tallying the losses of Earth's animals and plants, inmixed with an interview with David Jablonski, paleontologist at the University of Chicago. Five major extinctions in evolutionary history. Efforts today to estimate probable extinctions. "The consensus among conscientious biologists is that we're headed into another mass extinction, a vale of biological impoverishment commensurate with the big five" (pp. 58-59). Mathematical models will prove partially wrong, but importantly onto huge losses of biodiversity. Escalating populations, escalating consumption, human relocation of species deliberately and accidentally, will leave us with a planet of weeds. (v.10,#3)

Quammen, David, *Monster of God: The Man-Eating Predator in the Jungles of History and the Mind*. New York: W. W. Norton, 2003. History, legends, psychological and philosophical reflections on the big predators that are, or can become, man-eating: lions, tigers, the brown bear, sharks, the Nile crocodile, leopards, possibly cougars, and others. In the 1900s tigers (usually females) were regularly killing and eating some 800 persons a year; over a number of years one tiger alone killed possibly 400 persons before Jim Corbett shot her. The conservation of such predators; or, Quammen thinks more likely, their eventual extinction in the wild. Alas, a dark and scary forest may have been a good thing.

Rabb, J. Douglas. "From Triangles to Tripods: Polycentrism in Environmental Ethics." Environmental Ethics 14(1992):177-83. Callicott's basic mistake in his much-regretted paper "Animal Liberation: A Triangular Affair" is to think of the anthropocentric, zoocentric, and biocentric perspectives as mutually exclusive alternatives. An environmental ethics requires, instead, a polycentric perspective that accommodates and does justice to all three positions in question. I explain the polycentric perspective in terms of an analogy derived from the pioneering work of Canadian philosopher Rupert C. Lodge and distinguish it from both pragmatism and moral pluralism. Rabb is in the philosophy department, Lakehead University, Ontario, Canada. (EE)

Rabb, J. Douglas "The Vegetarian Fox and Indigenous Philosophy: Speciesism, Racism, and Sexism." I critique the oppressive society in which Michael A. Fox's Deep Vegetarianism was written and which Fox too attempts to criticize and change. Fox proves himself to be among a handful of Western philosophers open-minded enough to acknowledge and attempt to learn from North American indigenous values and world views. For this reason, he should be commended. In defending his thesis that a vegetarian life style

is morally preferable, he draws upon indigenous thought, feminist philosophy, and antidomination theories, arguing that speciesism, racism, and sexism can all be traced back to the same mind-set of oppression, domination and exploitation. Unfortunately, identifying the oppressive mind-set is not ipso facto escaping it. I show that Fox in his explication and use of indigenous thought actually perpetuates the very oppression and exploitation he argues against. Environmental Ethics 24(2002):275-294. (EE)

Radder, Hans, "Exploiting Abstract Possibilities: A Critique of the Concept and Practice of Product Patenting," Journal of Agricultural and Environmental Ethics 17(2004):275-291. Developments in biotechnology and genomics have moved the issue of patenting scientific and technological inventions toward the center of interest. In particular, the patentability of genes of plants, animals, or humans and of genetically modified (parts of) living organisms has been discussed, and questioned, from various normative perspectives. This paper aims to contribute to this debate. For this purpose, it first explains a number of relevant aspects of the theory and practice of patenting. The focus is on a special and increasingly significant type of patents, namely product patents. The paper provides three general arguments against the concept and practice of product patenting. The first argument briefly considers the claim that patents are legitimate because they promote socially useful innovation. Against this claim, it is argued that product patents may hamper rather than promote such innovation. The second and main argument concludes that product patents are not adequately based on actual technological inventions, as they should be according to the usual criteria of patentability. The principal moral issue is that product patents tend to reward patentees for inventions they have not really made available. The final argument proposes a method for patenting the heat of the sun. Assuming that granting this patent will be generally considered absurd, the argument exposes a further, fundamental problem of the concept and practice of product patenting. Keywords: (product) patents, biotechnology and genomics, experimental science and technology, reproducibility of inventions. The author is on the Faculty of Philosophy, Vrije Universiteit, Amsterdam, The Netherlands. (JAEE)

Raglon, Rebecca, Scholtmeijer, Marian, "Shifting Ground: Metanarratives, Epistemology, and the Stories of Nature," Environmental Ethics 18(1996):19-38. Recent discussions concerned with the problematical human relationship with nature have justifiably focused on the important role that language plays in both defining and limiting knowledge of the natural world. Much concern about language among environmental thinkers has been focused at the semantic level—proposing and analyzing definitions of certain key terms, such as anthropocentric, biocentric, wilderness, ecology, or holistic. Work at the semantic level, however, has had very little effect in challenging the scientific metanarrative of nature which is based on the primacy of objective knowledge. Using examples from three postmodern stories, we suggest that the only real challenge to the way humans presently construct and understand their relationship to nature can be found at the narrative level. In our discussion of these stories, we show that nature ceases to be a passive, designified object of the human eye. The result of these narrative shifts is a conception of nature composed of other subjects and other realities rather than a nature rendered meaningless by objectivity. Raglon is in women's studies, University of British Columbia. Scholtmeijer is at the University of Northern British Columbia. (EE)

Räikkä, Juha, "Coercive population policies, procreative freedom, and morality," Philosophy and Geography 4 (No. 1, 2001): 67-77. I shall briefly evaluate the common claim that ethically acceptable population policies must let individuals to decide freely on the number of their children. I shall ask, first, what exactly is the relation between population policies that we find intuitively appealing, on the one hand, and population policies that maximize procreative freedom, on the other, and second, what is the relation between population policies that we tend to reject on moral grounds, on the one hand, and population policies that use coercive methods such as laws or economic incentives and deterrents, on the other. I shall argue that when changing a population policy, it may be morally desirable to affect people's procreative decisions more rather than less, and that sometimes it may be morally desirable to prefer a population policy that does not maximize procreative freedom to a population policy that does maximize it. I shall also point out that indirect population policies that use incentives and deterrents are not necessarily incompatible with liberal principles. Finally, I try to show what is assumed by those who defend the view that coercive population policies are morally wrong in all circumstances. Räikkä is Professor of Theoretical Philosophy at the University of Turku. (P&G)

Raines, Ben, "Rare Fish Found in Grand Bay (Alabama\Mississippi)," Mobile (Alabama) Register, November 22, 2004, p. 1A, 4A. The rare opossum pipefish has been found in Grand Bay, a few feet from the Alabama/Mississippi state line. Mississippi has protected its part of the bay, but Alabama has not and has been considering permitting prospecting for natural gas there. The fish is a candidate species for the endangered species list; the only other known population is on the Atlantic coast of Florida. The fish is

unusual in that the males are "pregnant," or, more accurately, the males have a belly pouch in which they brood the eggs. The pipefish is long and slim, about the size of and looks like a greenish pencil. There are other species of pipefish but this one is unusual for the mid-belly brooding pouch, hence the name "opossum" pipefish. (v.14, #4)

Raines, Ben, "Experts: Fish Rally When Gill Nets Gone," (Mobile Alabama) Press Register, October 6, p. 1A, 16A. Alabama permits gill netting off its coasts. Other states, Florida, Mississippi, Texas, Louisiana have essentially stopped permitting gill netting, with a rebound of fish populations. Scientists now say that Alabama's liberal commercial regulations are depleting stocks of desirable fish in Alabama waters, also having a quite adverse effect from "by catch," fish and other marine animals that are not desired but are nevertheless caught and killed in the half-mile long nets that sweep from bottom to surface. With 120 licensed gill netters Alabama can have more than 54 miles of nets stretched out in its waters on any given night. Alabama requires gill netters to operate at night, so as not to disturb sports fishing during the day, but sportsmen complain that by dawn there are no fish left.

Raines, Ben, "ConocoPhillips Withdraws LNG Proposal," Mobile (Alabama) Press-Register, June 9, 2006, pp. 1A, 4A. ConocoPhillips has now withdrawn its controversial proposal to build an off-shore liquid natural gas terminal eleven miles off the Alabama coast. Liquid natural gas arrives in tankers at minus 260 degrees and must be warmed to convert it into a usable product. Here it was to be warmed using 150 million gallons of seawater a day, sucked in with eggs and larvae of marine species, including some of the Gulf's most popular recreational and commercial fish species, as well as shrimp and crabs. The environmental damage was judged unacceptable. The Alabama governor had said that he would veto the terminal.

Raines, Ben. "State's Sad Salamander." *Mobile Alabama Press-Register* (June 17, 2008): 1A, 4A. The Red Hills salamander lives in wet burrows in the deep hollows of Alabama's Red Hills and is endemic there. It has tiny legs and hardly walks, but it burrows with a thick skull. The salamander is listed as a threatened species. Only about 150 acres, less than one percent of its range, is protected, and there is illegal dumping even there. The Alabama Department of Transportation did abandon plans to widen a highway for a truck passing lane with some concerns about salamander populations.

Rajan, S. Ravi, "Disaster, Development and Governance: Reflections on the "Lessons" of Bhopal," Environmental Values 11(2002):369-394. The paper firstly uses the case study of the Bhopal gas disaster to understand why many scholars and activists seek alternatives to "big" development. Secondly, it critically examines the claims that have been made in this regard in the literature in political ecology, science and technology studies and environmental governance, and in doing so, articulates a framework of questions for the next generation of research and advocacy. (EV)

Rajan, Sudhir Chella. "Automobility, Liberalism, and the Ethics of Driving." *Environmental Ethics* 29(2007):77-90. Automobility, or the myriad institutions that foster car culture, has rarely if ever been put under the lens of liberal political theory, even though driving is one of the most common and widely

accepted features of daily life in modern societies. When its implied promise of guaranteeing both freedom and equality is examined more closely, however, it appears that the ethical implications of driving may be darker than initially supposed. Automobility may indeed be in violation of both the Kantian categorical imperative and Gewirth's principle of generic consistency, even though there has thus far been remarkably little ethical analysis to reveal these possibilities. It is conceivable that liberal political theory has turned a blind eye to automobility precisely because the latter has naturalized us into accepting what Roberto Unger has called a routine of "false necessity," so that driving is now virtually imperceptible as a social fact worthy of critical analysis. Ramjoué, Celina, "The transatlantic rift in genetically modified food policy," *Journal of Agricultural and Environmental Ethics* 20(2007):419-436. The regulatory structures underlying United States and European Union policies regarding genetically modified (GM) food and crops are fundamentally different. The US regulates GM foods and crops as end products, applying roughly the same regulatory framework that it does to non GM foods or crops. The EU, on the other hand, regulates products of agricultural biotechnology as the result of a specific production process. Accordingly, it has developed a network of rules that regulate GM foods and crops specifically. As a result, US regulation of GM foods and crops is relatively permissive, whereas EU regulation is relatively restrictive. Why are genetically modified food policies in the United States and the European Union so strikingly different? In the light of the recent World Trade Organization dispute on agricultural biotechnology, it may seem that economic interests are the driving force behind policies. While they are certainly part of the picture, the issue is far more complex. This paper argues that three different elements help explain differences between US and EU GM food policies. First, an investigation of US and European policies of the 1970s and 1980s on recombinant DNA research and of events leading up to early GM food and crop regulation allows a deeper understanding of current policy. Second, scrutinizing underlying values and norms can uncover the beliefs that condition current GM food and crop policy. Third, an analysis of involved actors' views and levels of success in influencing policy is essential to understanding US and EU policies. Keywords: agricultural biotechnology - comparative public policy - genetically modified crops - genetically modified food - public policy - regulation. Ramjoué is at the European Commission, Brussels, Belgium.

Raoult-Walk, Anne-Lucie, and Bricas, Nicolas, "Ethical Issues Related to Food Sector Evolution in Developing Countries: About Sustainability and Equity," Journal of Agricultural and Environmental Ethics 15(no. 3, 2002):325-334. After a century of major technical advance, essentially achieved by and for the industrialized countries, the evolution of the food sector in southern countries should no longer be thought of in terms of a "headlong pursuit." In the present context of demographic growth, urbanization, poverty and disparities, environmental degradation, and globalization of trade, new priorities have emerged, and new ethical questions have been raised, mainly related to sustainability and equity. This paper analyses these ethical concerns in the following terms: can the model of food sector development initiated by the industrialized countries be applied to the entire world on a sustainable and equitable basis, given the effects of this development with regard to the energy consumed, the changes in dietary behavior and related nutritional problems, the new demands in terms of food safety, the questions of biodiversity, ownership of knowledge, cultural identities, gender issues, and Man's relationship to food and Nature? KEY WORDS: biodiversity, cultural identity, developing countries, dietary behavior, energy, equity, food safety, gender issue, knowledge property, sustainability. The authors are in Montpellier, France. (JAEE)

Raphael, Ray, More Tree Talk: The People, Politics, and Economics of Timber. Washington, DC: Island Press, 1994. 352 pages. Paper, \$ 17.00. A sequel to Tree Talk in 1981. A running narrative that focuses on people's lives and livelihood in the midst of a declining resource base and increasing regulatory policies. Without an understanding of the economic and political factors that interfere with good forest management, all the scientific knowledge and the best intentions of on-site workers will come to no avail. Raphael is a writer in northern California, who grows timber and teaches school. (v5,#1)

This book is directed toward practical guidance for academic students, faculty, and staff. The authors, both involved in Tufts' University Climate Initiative, argue that colleges and universities can serve as communities for strategizing and organizing effective action, laboratories for learning and centers of research, and models for how to reduce greenhouse gas emissions, all directed toward mitigating global climate change.

Rappaport, David J., "What Constitutes Ecosystem Health?" Perspectives in Biology and Medicine 33(1) (1989):120-132. There are analogies and disanalogies between human health and ecosystem health. Three measures of ecosystem health are: the identification of critical characteristics or vital signs,

measures of the counteractive capacity to handle stress loadings, risk factors from certain anthropogenic stresses. Naturally healthy ecosystems can be more periodic or fluctuate more widely than sometimes thought. What counts as a healthy managed ecosystem, including an agro-ecosystem? A useful article, reasonably short, and readable by students. (v1,#3)

Rapport, David J. "Ecosystem Health: More than a Metaphor?" Environmental Values 4(1995):287-309. There is considerable discussion about the nature of the health metaphor as applied to ecosystems. One does not need to accept the analogy of ecosystem as 'organism' to reap insight into the diagnosis of ecosystem ills by applications of approaches pioneered in the health sciences. Ecosystem health can be assessed by the presence or absence of signs ecosystem distress, by direct measures of ecosystem resilience or counteractive capacity, and by evaluation of risks or threats from human activity and natural forces which may decrease the supply of ecological services. The focus of this essay is on what is and what is not implied by the ecosystem health metaphor. It also elaborates a research agenda for this emerging transdisciplinary science. One can argue that beyond the metaphor is the potential for systematic diagnosis of ecosystem ills, development of indicators of ecosystem health, development of early warning indicators of ecosystem dysfunction, development of diagnostic protocols and preventive strategies for maintaining ecological services. Rasmussen, Larry, "Toward an Earth Charter," Christian Century 108 (no. 30, October 23, 1991):964-967. The Earth Summit at Rio de Janeiro is inviting NGO's, including Christian Churches, for guidance in formulating an Earth Charter. What might Christian say, drawing on the World Council of Churches' Canberra Assembly? Models are dominion, stewardship, partnership, sacramentalism, ecofeminism, a prophet-teacher model, and an evolutionary. Rasmussen proposes an evolutionary sacramentalist cosmology. The Rio conference is really an assignment in philosophical metaphysics that can be made operational on a global scale. Rasmussen is professor of social ethics at Union Theological Seminary, New York.

Rasmussen, Larry L. Earth Community Earth Ethics. Maryknoll, New York: Orbis Books. 1996. 366 pp. Paper \$20. Probably the most insightful analysis yet produced from a theological perspective of social justice and ecological concerns, though Michael Northcott's The Environment and Christian Ethics still excels in his dialogue with philosophers. "An attempt to lean into the world in a way that receives earth, with its distress, graciously" (p. 319). A green critique of history, of the human desires for dominion over earth that have driven Western science, development, technology, industry, politics, and religion since the Enlightenment. An underlying theme is "justice, peace, and the integrity of creation" (World Council of Churches), where Rasmussen was influential.

To conceive of humans as apart from nature, rather than a part of nature is "nature/humanity apartheid" (pp. 32-33, 328). "The essence of sin in this perspective is to try to rise above nature" (p. 274), seeking arrogant dominion over nature, denying the wholeness of creation. But, Rasmussen, as an ethicist, in the end has to notice some apartness. "Humans, as a part of nature, cannot escape their distinctive work as moral creatures" (p. 347). We intervene in "a nature too casual about pain, suffering, and death" (p. 347).

"For all their power as articulations of faith amidst several historical crises, canonical Protestant theologies from the 1930's to the 1970's were miserably deficient as cosmologies. They located human beings in the cosmos in ways that alienated us from the rest of nature and set the living substance of nature's infinite variety over against us. Nature was submissive objects at the disposal of creative subjects, human beings. ... A cosmic community of a million living subjects became little more than a collection of user-friendly objects. ... The need now is for those symbols that effect a 'reenchantment of the world' that edges out the deadly cosmology of mindless and valueless nature ... in which the Spirit is the energy and power of God present in all creation as its very animation. ... The Spirit's presence is not

amidst, nor its work for, one species only." Rasmussen is Reinhold Niebuhr Professor of Social Ethics at Union Theological Seminary, New York. (v9,#2)

Rasputin, Valentin, Siberia on Fire. DeKalb, IL: Northern Illinois University Press, 1989. Selected, translated, and introduced by Gerald Mikkelson and Margaret Winchell. 230 pages. Rasputin is one of the most influential leaders of his country's environmental protection movement, deeply concerned over the resources of Siberia, and their exploitation. He writes with skill and the translation is excellent. "Every now and then I recall the 'philosophy' of one old man, Grandpa Yegor, from my own native village, which still stood on the banks of the Angara River back then (but was being moved to make way for a large dam, inundating much of the area). ... Illuminated by the sunset that caressed the Angara, we were sitting on some logs when Grandpa Yegor ... nodded vaguely toward the river--before us unfolded a scene of rare beauty ... 'If you want to know, I never harmed my own land.' ... I cannot say that the Siberian's feeling for the land of his forefathers is more intense than that of a European Russian, but it is undoubtedly fresher and more self-engrossed, more tangible, it would seem, more personal. ... [But] Siberians today are ceasing to exist as the composite of their former stable features and are outliving their distinctiveness, wearing it out like old clothes" (pp. 174-175). Rasputin, a literary figure in Siberia, lives in Irkutsk and spends much of his time in a cottage on the Angara River near Lake Baikal. (Thanks to Phil Pister.)

Rastetter, Edward B., "Validating Models of Ecosystem Response to Global Change", Bioscience, 46(No.3, 1996):190- . How can we best assess models of long-term global change?

Ratcliffe, Derek. "More thoughts on nature conservation and the voluntary principle." Environmental Values 4(1995):71-72. John Francis' article (Environmental Values 3: 267-71) is a welcome exposure of a serious problem, but skates around the political nature of the voluntary principle and fails to challenge its validity head-on. The voluntary principle is an integral part of the current British Government's ideological obsession with minimising controls and the intervention of the state. Applied to nature conservation, it is particularly intended to protect the rights of property in land. Ratcliffe resides in Cambridge, U.K. (EV)

Ratner, Ty. "An Environmentalist's Lament on Predation." Environmental Ethics 30(2008):417-434. That some animals need to prey on others in order to live is lamentable. While no one wants predators to die of starvation, a world in which no animal needed to prey on others would, in some meaningful sense, be a better world. Predation is lamentable for four primary reasons: (1) predation often inflicts pain on prey animals; (2) it often frustrates prey animals' desires; (3) anything other than lamentation—which would include relishing predation as well as being indifferent to it—is in tension with sensitivity to many other forms of hardship and suffering; and (4) lamenting is demanded by the virtues of compassion and gentleness. One can lament predation even while acknowledging respects in which predation is genuinely praiseworthy. One can esteem admirable traits developed through and displayed in predation without esteeming the mechanism through which they are developed or the activity in which they are displayed. In addition, appreciating the check on population that predation provides does not preclude lamenting predation. While holding these positions does involve (in some sense) opposing nature itself and failing to appreciate predators for exactly what they are, doing so does not disqualify a person as an environmentalist. Finally, one can lament predation without being logically committed thereby to preventing or disrupting it. (EE)

Pages 68-86 in West, Patrick C., and Brechin, Steven R., Resident Peoples and National Parks: Social Dilemmas and Strategies in International Conservation. Tucson, AZ: The University of Arizona Press, 1991. The Gir National Park is situated in the western Indian state of Gujarat, home to diverse wildlife, including panthers, jackals, jungle cats, hyena, spotted deer, Indian gazelle, nilgai, and antelope. It also protects the last population of the Asiatic lion, a subspecies distinct from the African lion, smaller in size, with shorter mane, and different behavioral characteristics. The Asiatic lion once roamed throughout southwest Asia through Greece and northern Africa. Only about 250 remain in the park.

The park has been under some kind of protection for most of the twentieth century, but there are still about 4,800 Maldhari people living in and around the park. Typically poor, they herd cattle, and make ghee from the milk. Lions occasionally prey on their cattle. Their cattle overgraze the park and diminish wildlife on which the lions might prey. The Maldhari people poison the lions. There are varied and complex factors, but a basic choice seems clear: Either choose the Maldhari or the Asiatic lion.

Raven Peter H., "Science, Sustainability, and the Human Prospect," Science 297 (9 August 2002):954-958. The presidential address of a noted conservationist to the American Association for the Advancement of Science, with as much ethics in it as science. We looked forward to a world with (Franklin Delano Roosevelt's) four freedoms: freedom of speech, freedom to worship, freedom from want, freedom from fear. Where have those dreams gone? Most of the world is no better off today than then, despite advances in science and technology. Americans enjoy more privilege than most and show little responsibility for a planetary future in crisis. "It is against our common interests that hundreds of millions of women and children, living in extreme poverty, are unable to make the best use of their abilities. Such discrimination, whether we focus on it or not, is morally abhorrent" (p. 957). Raven is director of the Missouri Botanical Garden, St. Louis. (v.13,#4)

Raven, Peter. "Appreciating Diversity: Human and Botanical." *Public Garden* Vol. 22, no. 2 (2007): 5-7.

Raven introduces a themed issue on the work of botanical gardens in international plant conservation, with education and culturally-based appeals integral to plant conservation. Raven directs the Missouri Botanical Garden.

Ravetz, Jerome R., "Food Safety, Quality, And Ethics--A Post-Normal Perspective," Journal of Agricultural and Environmental Ethics 15(no. 3, 2002):255-265. I argue that the issues of food quality, in the most general sense including purity, safety, and ethics, can no longer be resolved through "normal" science and regulation. The reliance on reductionist science as the basis for policy and implementation has shown itself to be inadequate. I use several borderline examples between drugs and foods, particularly coffee and sucrose, to show that "quality" is now a complex attribute. For in those cases the substance is either a pure drug, or a bad food with drug-like properties; both are marketed as if they were foods. An example of the inadequacy of old ways of thinking is obesity, whose causes are as yet outside the purview of medicine, while its effects constitute an epidemic disease. The new drug/food syndrome needs a new sort of science, what we call "post-normal." This is inquiry at the contested interfaces of science and policy; typically it deals with issues where facts are uncertain, values in dispute, stakes high, and decisions urgent. With the perspective of post-normal science, we can better understand some key issues. We see that "safety" is different from "risk," being pragmatic, moral, and recursive. Also, we understand that an appropriate foundation for regulation and ethics is not so much "objectivity" as "awareness." In an age when "consumers" are becoming concerned "citizens," the relevant science must become post-normal. KEY WORDS: ethics, food safety, post-normal science, quality. Ravetz is with The Research Methods Consultancy Ltd., London. (JAEE)

Reader, John, Africa: A Biography of the Continent. New York: Alfred A. Knopf, 1998. London: Hamish Hamilton, 1997. 801 pages. "Africa as a dynamic and exceptionally fecund continent, where the evolution of humanity is merely one of many developmental trajectories that are uniquely evident there. The narrative follows the development of the continent from its earliest manifestation to the present; it identifies the physical processes which have determined the course of the developmental progressions and, where relevant, defines the ecological context in which they occurred. Human evolution is an important case in point, because critical stages of human evolution were adaptive responses to the ecological imperatives of the African environment" (p. xi). "Once established for a few generations, civilization might seem durable enough to last forever. But the skin of enlightened self-interest is very delicate, easily eroded, and the human capacity for unspeakable barbarity lies just beneath its surface. Africa's horrors are chilling examples of what people are capable of doing to another when short-term exploitation has taken over from long-term regulation, when the notion of accountability has been swept aside and the promise of the future is hidden by the trials of surviving in the present. Africa's tragedies diminish everyone, for humanity evolved in Africa, and we hold everything in common--not least our destiny, now that the limits of global exploitation are understood" (pp. x-xi). "Africa is the 'dark continent,' ... the place where a very particular form of darkness is found--the darkness of humanity" (p. x). Reader is a British/African photojournalist. (v.9,#3)

Redclift, Michael R. Frontiers: Histories of Civil Society and Nature. Cambridge: The MIT Press, 2006. Nature and society in frontier areas, as contested zones in which rival versions of civil society vie with

one another, often over the definition and management of nature itself. A dialectical process in which human societies and their environments influence and illuminate one another. The frontier can be seen as a crucible in which both nature and civil institutions develop and “co-evolve.”

Redclift, Michael, "Sustainable Development: Needs, Values, Rights." Environmental Values Vol.2 No.1(1993):3-20. ABSTRACT: `Sustainable development' is analyzed as a product of the Modernist tradition, in which social criticism and understanding are legitimized against a background of evolutionary theory, scientific specialization, and rapid economic growth. Within this tradition, sustainable development emphasizes the need to live within ecological limits, but allows the retention of an essentially optimistic idea of progress. However, the inherent contradictions in the concept of sustainable development may lead to rejection of the Modernist view in favour of a new vision of the world in which the authority of science and technology is questioned and more emphasis is placed on cultural diversity. KEYWORDS: Development, environment, modernism, needs, post-modernism, sustainability, values. Wye College, University of London, Near Ashford, Kent TN25 5AH, UK.

Redclift, Michael R. *Frontiers: Histories of Civil Society and Nature*. Cambridge, MA: MIT Press, 2006. Redclift defines frontier areas as contested zones in which rival versions of civil society vie with one another, and he examines five case studies: the Spanish Pyrenees, the forest frontier of Canada, coastal Ecuador, the Yucatán peninsula, and the Mexican Caribbean coast where civil societies emerged in frontier areas to either legitimize private holdings or manage common property. He argues that the frontier is a crucible where both civil institutions and nature develop and co-evolve in a dialectical fashion, and resistance to economic market pressures in frontier areas can create new avenues for political activity and the representation of cultural identity.

Redclift, Michael R. *Frontiers: Histories of Civil Society and Nature*. Cambridge, MA: MIT Press, 2006. Redclift defines frontier areas as contested zones in which rival versions of civil society vie with one another, and he examines five case studies: the Spanish Pyrenees, the forest frontier of Canada, coastal Ecuador, the Yucatán peninsula, and the Mexican Caribbean coast where civil societies emerged in frontier areas to either legitimize private holdings or manage common property. Redclift, Michael. "Environmental Security and the Recombinant Human: Sustainability in the Twenty-first Century," Environmental Values 10(2001):289-300. Examining the concepts of "security" and "sustainability", as they are employed in contemporary environmental discourses, the paper argues that, although the importance of the environment has been increasingly acknowledged since the 1970s, there has been a failure to incorporate other discourses surrounding "nature". The implications of the "new genetics", prompted by research into recombinant DNA, suggest that future approaches to sustainability need to be more cognisant of changes in "our" nature, as well as those of "external" nature, the environment. This broadening of the compass of "security" and "sustainability" discourses would help provide greater insight into human security, from an environmental perspective. Keywords: Nature, discourse, recombinant DNA, security, sustainability, carbon politics. Michael Redclift is in the Department of Geography, Kings College London, London, UK. (EV)

Redford, Kent H., "The Ecologically Noble Savage," Orion Nature Quarterly, vol. 9, no. 3, 1990, pp. 25-29. Indigenous knowledge is important because "it reflects the accumulated wisdom of unique cultures ... and occasionally, though only occasionally, it offers methods that, when modified, can be of use to inhabitants, native and nonnative, in the modern Neotropics." Nevertheless "the ecologically noble savage" is a myth; "the recently accumulated evidence ... refutes this concept of ecological nobility." "These people behaved as humans now do; they did whatever they had to to feed themselves and their

families," often with adverse environmental results. Redford is with the Center for Latin American Studies and the Department of Wildlife at the University of Florida. (v4,#1)

Reed Christopher, "Driving Birds Away," Harvard Magazine 107 (no. 5, May-June, 2005):11-13. Ecologist Richard T. T. Forman has discovered that grassland birds (such as bobolinks and meadowlarks) are quite susceptible to the noise from busy highways. They will tolerate 3,000-8,000 vehicles per day, are affected seriously by two-lane highways with 15,000-30,000 vehicles per day, and will neither breed nor go within three-quarters of a mile of multi-lane highways with over 30,000 vehicles per day. Tree nesting birds are not similarly affected. His theory is that grassland birds depend on warning clicks to their nestlings, hidden in nests in the grass, when predators are nearby. Such clicks cannot be heard by the nestlings because of the traffic noise. In busy New England, this quite adversely affects grassland birds.

Reed, Edward S., Toward an Ecological Psychology. New York: Oxford University Press, 1996. 224 pp. \$ 35.00. The human niche, and the psychology by means of which humans, and animals, make their way through the natural, and social, worlds. Reed is at Franklin and Marshall College. (v9,#1)

Reed, Peter, "Man Apart: An Alternative to the Self-Realization Approach," Environmental Ethics 11(1989):53-69. A discussion from within the perspective of deep ecology suggesting an alternative to the principle of self-realization. Reed emphasizes the sense of "otherness" and "holiness" of nature. He attempts to make sense of the notion of "awe" and to make it a respectable philosophical position. But Reed realizes that all deep ecology (including his view) rests on intuitions that may not be universal. (Reed died in an avalanche in March 1987. The philosophical community has lost an able commentator on deep ecology.)

Reed, Peter and David Rothenberg, eds., Wisdom in the Open Air: The Norwegian Roots of Deep Ecology. University of Minnesota Press, 1992. 288 pages. \$ 44.95 cloth, \$ 18.95 paper. A collection of papers by prominent Norwegian thinkers on humanity and nature, most never before published in English. (v3,#2)

Reed, Peter. "Man Apart: An Alternative to the Self-Realization Approach." Environmental Ethics 11(1989):53-69. Seeing nature as ultimately separate from us rather than as a part of us is the source of a powerful environmental ethic. The work of Martin Buber, Rudolf Otto, and Peter Wessel Zapffe forms the conceptual framework for a view of nature as a Thou or a "Wholly Other," a view which inspires awe for the nonhuman intrinsic value in nature. In contrast to the Self-realization approach of Naess and others, intrinsic value is here independent of the notion of a self. This approach suggests an ethic of humility and respect for nonhuman nature--to the degree that the continued existence of humans should be considered an open question. Reed worked at the Council of Environmental Studies in Oslo, Norway from the fall of 1986 until his accidental death in March 1987. (EE)

Rees, William E., and Wackernagel, Mathis, Our Ecological Footprint. Gabriola Island, B.C., Canada: New Society Publishers, 1996. The authors propose an ecological worldview in contrast with the prevailing expansionist worldview. "An ecological economic perspective would see the human economy as an inextricably integrated, completely contained, and wholly dependent subsystem of the ecosphere" (p. 4) "The ecological footprints of individual regions are much larger than the land areas they physically occupy" (p. 16)

Rees, William, "Ecological Footprint, Concept Of," Encyclopedia of Biodiversity 2: 229-244. Ecological footprint analysis is a quantitative tool that represents the ecological load imposed on the earth by humans in spatial terms. Thus, the ecological footprint of a defined population is the total area of land and water ecosystems required to produce the resources that the population consumes, and to assimilate the wastes

that the population generates, wherever on earth the land/water are located. Ecofootprinting can be used to assess the ecosystem area effectively "appropriated" in support of any specified human population or economic activity. (v.11,#4)

Reflections: Newsletter of the Program for Ethics, Science, and the Environment, Department of Philosophy, Oregon State University, Special Issue 3, August 1998, is devoted to Aldo Leopold, after fifty years. Regan, Tom, "Ethical Perspectives on the Treatment and Status of Animals" (Animal Welfare and Rights), Encyclopedia of Bioethics, revised ed. (New York: Macmillan Library Reference, Simon and Schuster, 1995), 159-71. (v6,#2)

Regan, Tom, ed. Animal Sacrifices. Reviewed in Environmental Ethics 10(1988):181-82.

Regan, Tom, Empty Cages: Facing the Challenge of Animal Rights. Lanham, MD: Rowman and Littlefield, 2004. Regan asks readers to confront the miserable conditions we have inflicted on animals--not only in the familiar cases of factory farming, product testing, and hunting, but in less well-documented areas such as greyhound racing and circus performances. Advocates for animal rights are not crazy extremists, but thoughtful people who follow an argument to its logical conclusion, and when others do so animals everywhere will benefit.

Regan, Tom, Animal Rights, Human Wrongs: An Introduction to Moral Philosophy. Lanham, MD: Rowman and Littlefield, 2003. The argument for animal rights through the exploration of two questions central to moral theory: What makes an action right? What makes an act wrong? Contractarianism, utilitarianism, and Kantian ethics. A theoretical framework to ground a responsible pro-animal rights perspective. How asking moral questions about other animals can lead to a better understanding of ourselves. Regan is emeritus professor of philosophy at North Carolina State University.

Regan, Tom, The Thee Generation: Reflections on the Coming Revolution. Temple University Press, forthcoming January 1991. \$ 24.95. Essays with the central philosophical theme that an anthropocentric ethics cannot be rationally defended and that moral consideration extends further than humans to include animals and a responsibility to protect the larger community of life. "The human life is but one life form among many, and what distinguishes us from the larger community of life is not our power to subdue but our responsibility to protect." Includes essays in biomedical research, feminism and vivisection, child

pornography (paradigmatically wrong by a logic from which it also follows that vivisection is wrong), abolishing animal agriculture, on Christians and what they eat, on the harmony and also irreconcilable differences between ecofeminists and deep ecologists, especially Carolyn Merchant, Marti Kheel, George Sessions and Bill Devall. Those interested in environmental ethics will be especially interested in Regan's analysis of environmental holism (Leopold's land ethic) in the essay on animal agriculture. Christians will be interested in Regan's analysis of whether Christians ought to eat meat. (v1,#2)

Regan, Tom, ed., Animal sacrifices: Religious perspectives on the use of animals in science. Philadelphia: Temple University Press, 1986.

Regan, Tom, ed., Earthbound: New Introductory Essays in Environmental Ethics. New York: Random House, 1984. Pp. x, 371. This is the third anthology in a series that attempts to provide high quality introductory essays on various ethical problems. It covers a wide range of issues, but not all equally well. Tibor R. Machan's essay on "Pollution and Political Theory" (pp. 74-106) has little to do with environmental ethics; it is just another argument for libertarianism. Annette C. Baier's "For the Sake of Future Generations," (pp. 214-246) is hardly an introductory essay. Rather than present an overview of future generations arguments, she examines Parfit's identity problem in some detail--an argument that will confuse the beginning student for whom the book is designed. The last two essays, Alastair Gunn, "Preserving Rare Species," (pp. 289-335) and Edward Johnson, "Treating the Dirt," (pp. 336-365) are each clear comprehensive reviews of issues that form the heart of environmental ethics. Also of interest are: K. S. Shrader-Frechette, "Ethics and Energy," (pp. 107-146), which canvasses several arguments in favor of both soft and hard energy policies. Neither policy is "risk-free" despite the rhetoric of environmentalists who advocate soft energy. The real issue is thus the "ethical desirability of particular risk displacements" (p. 122). Mark Sagoff, "Ethics and Economics in Environmental Law" (pp. 147-178), provides a good introduction to, and a criticism of, economic rationality (cost-benefit analysis) and its relation to social policy. It is legislative procedures, and not cost-benefit analyses, which best express the social values, goals, and ideals of the citizen and the community. William Aiken, "Ethical Issues in Agriculture," (pp. 247-288), provides not only an introduction to the ethics of agricultural issues but also an excellent review of the major anthropocentric and non-anthropocentric theories of environmental ethics. Aiken tries to develop a compromise position he calls "eco-humanism": this view places value both in natural ecological systems and in the human ability for self-conscious cognitive activity. The book also includes an introductory essay on ethics by Tom Regan, an essay on the urban environment by Dale Jamieson, and an essay on the use of ocean resources by Robert L. Simon. One major flaw of this text is that there is no comprehensive bibliography. (Katz, Bibl # 1) Reviewed in Environmental Ethics 7(1985):373-75.

Regan, Tom. "On the Connection between Environmental Science and Environmental Ethics." Environmental Ethics 2(1980):363-67. I critically assess Don Marietta's thesis that obligations are not dictated of reason but rather are imbedded in a person's "world view." The notion of "a view of the world" is both vague and leads to consequences common to all forms of subjectivism in ethics, since world views can and sometimes do vary from person to person. Marietta cannot avoid these consequences by arguing that some views of the world are "more reasonable" than others, since counting rationality as an appropriate basis for choosing between world views is itself to favor a particular view of the world. Neither then can Marietta consistently argue for the preferability of a world view which grounds our obligations regarding the ecosystem in environmental science. Given his general position, this can only tell us what he prefers, not what is preferable. Regan is at the department of philosophy and religion, North Carolina State University, Raleigh. (EE)

Regan, Tom. "The Nature and Possibility of an Environmental Ethic." Environmental Ethics 3(1981):19-34. A conception of an environmental ethic is set forth which involves postulating that nonconscious natural objects can have value in their own right, independently of human interests. Two kinds of objection are considered: (1) those that deny the possibility (the intelligibility) of developing an ethic of the environment that accepts this postulate, and (2) those that deny the necessity of constructing such an ethic. Both types of objection are found wanting. The essay concludes with some tentative remarks regarding the notion of inherent value. Regan is at the department of philosophy and religion, North Carolina State University, Raleigh. (EE)

Regan, Tom. All That Dwell Therein. Reviewed in Environmental Ethics 7(1985):81-86.

Regan, Tom. "Animal Rights, Human Wrongs." Environmental Ethics 2(1980):99-120. In this essay, I explore the moral foundations of the treatment of animals. Alternative views are critically examined, including (a) the Kantian account, which holds that our duties regarding animals are actually indirect duties to humanity, (b) the cruelty account, which holds that the idea of cruelty explains why it is wrong to treat animals in certain ways; and (c) the utilitarian account, which holds that the value of consequences for all sentient creatures explains our duties to animals. These views are shown to be inadequate, the Kantian account because some of our duties regarding animals are direct duties to animals; the cruelty account because it confuses matters of motive or intent with the question of the rightness or wrongness of the agent's actions; and the utilitarian account because it could be used to justify identifiable speciesistic practices. I defend a fourth view. Only if we postulate basic moral rights in the case of humans, can we satisfactorily account for why it is wrong to treat humans in certain ways, and it is only by postulating that these humans have inherent value that we can attribute to them basic moral rights. Consistency requires that we attribute this same kind of value to many animals. Their having inherent value provides a similar basis for attributing certain basic moral rights to them, including

the right not to be harmed. Possession of this right places the onus of justification on anyone who would harm these animals. I set forth conditions for such a justification which those who would abuse animals have failed to meet. Regan is at the department of philosophy and religion, North Carolina State University, Raleigh. (EE)

Regan, Tom. "Obligations to Animals are Based on Rights: Individual Rights Are Not Grounded in Prejudice." Journal of Agricultural and Environmental Ethics 8(1995):171-180. Some feminist philosophers criticize the idea of human rights because, they allege, it encapsulates male bias; it is therefore misguided, in their view, to extend moral rights to non-human animals. I argue that the feminist criticism is misguided. Ideas are not biased in favour of men simply because they originate with men, nor are ideas themselves biased in favour of men because men have used them prejudicially. As for the position that women should abandon theories of rights and embrace an ethic that emphasizes care: women who made this choice would not so much liberate themselves from "the patriarchy" as they would conform to its representation of women as emotional, subjective and irrational. There is, then, no good reason to withhold ascribing rights to non-human animals, based on the criticisms of rights made by some feminists. (JAEE)

Regosin is with the Nature Conservancy; Frankel is in biology, Boston University. (v.11,#3)

Rehmann-Sutter, Christoph, "Biological Organicism and the Ethics of the Human-Nature Relationship," Theory in Biosciences/Theorie in den Biowissenschaften 119(2000):334-354. A "hermeneutic approach" to organisms where their description as organisms matters ethically. The term "organism" seems to have been introduced in the early 1700's in contrast to "mechanism." "Organism" can be used to transcend "mechanism" and to specify the ontological difference. This ontological analysis has ethical implications. Rehmann-Sutter is with the Institute für Geschichte und Ethik der Medizin der Universität Basel, Switzerland.

Rehmann-Sutter, Christoph. "Involving Others: Towards an Ethical Concept of Risk." Risk: Health, Safety & Environment 9 (1998): 119-36. Criticizes the economic concept of risk that is widely used as the standard model in risk assessment literature, and develops an outline for an ethical concept of risk based on jurisprudential discussions on causation. Combines risk assessment procedures with the perspective of an ethic of care. (v.9,#3)

Rehmann-Sutter, Christoph; Vatter, Adrian; Seiler, Hansjörg. Partizipative Risikopolitik. Opladen/Wiesbaden: Westdeutscher Verlag, 1998. 366 pp. DM 58. ISBN 3-531-13222-9. In German. This book contains the results from an interdisciplinary research project on technico-ecological risks, their implications for political and ethical thinking, and the need to develop new democratic political institutions. The project was based at the University of Basel in Switzerland. Several models for a democratic management of technico-ecological risks are screened and evaluated. An adapted form of mediation seems to fit best the given environmental requirements. A thorough analysis of the ethical problem of imposing risks intends to show the biggest hindrances for participative politics and to describe the positive effects for the political culture. Included perspectives are ethics, political science, and jurisprudence. Existing experiences are combined into a detailed new practical concept that should be implementable. (v.9,#3)

Rehmann-Sutter, Cristoph. 1996 Leben Beschreiben: Ueber Handlungszusamme, "Hange in der Biologie." Würzburg: Königshausen & Neumann, 1996. 392 pages. SFr. 70.90. In German. The first part of the book deals with molecular biology as a paradigm of modern scientific description of living nature, and tries to analyze hidden pre-thoeretic (moral) decisions in its specific approach. The second part is a discussion of Aristotle's biology in the context of moral philosophy based on the dichotomy between "poiesis" and "praxis" (Nichomachean Ethics). The third part draws a trans-functionalistic description of life as organic practice: processes are in themselves the goal of being lived. (v7, #3)

Reice, Seth R., The Silver Lining: The Benefits of Natural Disasters. Princeton, NJ: Princeton University Press, 2001. Every tornado's funnel cloud, every forest fire's billowing cloud of smoke, every flood's raging water has tremendous benefits for the ecosystem it impacts. The shortsightedness of conceiving such events as disastrous to nature, and the resulting misinformed environmental policy, and how to form better policy. Reice is in biology and ecology at the University of North Carolina, Chapel Hill. (v.12,#4)

Reice, Seth R., "Nonequilibrium Determinants of Biological Community Structure," American Scientist 82(1994):424-435. Biological communities are always recovering from the last disturbance, their "normal" state. Natural systems are so frequently disturbed that equilibrium is rarely achieved. On the other hand, disturbance is scale dependent. If the area studied is large enough, all disturbances are predictable and "normal." If a disturbance is predictable, the biota can and will adapt to it; a disturbance that is unpredictable will have a greater impact. Disturbance and heterogeneity, not equilibrium, generate biodiversity. Disturbance should be viewed as both natural and beneficial to the world's biodiversity. We need to value, nurture, and preserve our planet's biodiversity. Understanding that heterogeneity and disturbance are important contributors to biodiversity will help us achieve these goals. Reice is in ecology at the University of North Carolina, Chapel Hill. (v5,#4)

Chicago: Fitzroy Dearborn Publishers, 1998. ISBN 1-57958-010-6. Oswald de Andrade (1890-1954) was a Brazilian intellectual and poet, a critic of the modern transformation of Brazilian society, with significant ecological insights. Reigota is at the Universidade de Sorocaba, Brazil. (v.10,#2)

Reigota, Marcos, "Tempo e Ecologia. Time and Ecology," Utopía y Praxis Latinoamericana: Revista Internacional de Filosofía Iberoamericana y Teoría Social, Año 3, No. 5, Julio-Diciembre 1998. As we analyze the notion of time in ecology, we must consider the history of life, its relation, to culture, values and representations that reflect the complex daily relationships between human beings throughout evolution of the Earth. The human presence is important on the evolutionary time scale, no matter how small it is. In ecological time there are elements that are inseparable and complementary. They are the improvised (unusual) instant, the limitless historical, geological and biological time and the question about the possibilities to come. Reigota is at the Universidade de Sorocaba, Brazil. (v.10,#2)

Reila, Heiki, Teoloogiline keskkonnaeetika ja inimkeskne traditsioon. Mõnede uudsete keskkonnaeetika lähete võrdlev analüüs (Environmental Ethics and the Tradition of Anthropocentrism. A Comparative Analysis of Some New Approaches in Contemporary Theological Ethics Confronting Environmental Problems) (in Estonian). University of Tartu, Estonia, Master's Thesis, 1996. Three approaches are featured: (1) stewardship, chapter 2, with Ronald Preston and James Gustafson as examples; (2) Christian ecofeminism (chapter 3), with Rosemary Radford Ruether and Sallie McFague as examples; and (3) the reverence for life (Chapter 4), with Andrew Linzey as an example. The three are critical of classical Christianity on grounds of (1) the dominion of man, (2) androcentrism, and (3) speciesism. There is a discussion of anthropocentrism versus non-anthropocentrism, and an argument that Christianity has been mostly anthropocentric. There is a need to shift to a more complicated ethics, based on biological and ecological knowledge. The advisor was Jaanus Noormägi. Reila is a Lutheran pastor at Vandra, Estonia (Address: Heiki Reila, Vandra EE 3461, Estonia). (v8,#2)

Reilly, Sean. "Alabama Sturgeon Vanishing." *Mobile (AL) Press Register* (December 9, 2007): 1A, 4A. Only one Alabama sturgeon has been caught in eight years. Biologists now fear there are too few for a captive breeding program. The fish is a listed endangered species, about 30 inches long, and one of only 25 sturgeon species in the world. At the turn of the last century, Alabama harvested 42,000 pounds of sturgeon. Biologists think the principal trouble is that damming of rivers has interrupted its spawning cycle.

Reilly, William K. on intrinsic value. The U.S. Environmental Protection Agency chief in a speech prepared for a gathering of Catholic leaders in Washington, declared that "natural systems have an intrinsic value--a spiritual worth--that must be respected for its own sake." A new "spiritual vision" of conservation and "an ethic of environmental stewardship grounded in religious faith ... could be a powerful force." Quoted in the Los Angeles Times, April 19, 1990, p. A3. (v1,#2)

Reiman, R. John, Toward an Ecological Ethic, Ph.D. thesis at Vanderbilt University, December 1991, in the Graduate Department of Religion. Reiman attempts a systematic introduction to a comprehensive environmental ethic. Chapter titles: Chapter 1: Nature and Humanity (Cartesianism, is/ought, facts/values; evolution and ecology). Chapter 2. Value Theory and the Use and Protection of the Natural World (value theory, the degradation of the natural world, conservation and preservation). Chapter 3: Approaches to Environmental Ethics (deontological and utilitarian approaches; cost/benefit analysis, holism). Chapter IV: The Boundaries of An Ecological Ethic (responsibilities to future generations, the extension of moral community, the question of human capacity seriously to consider the natural environment as a realm of duty). The thesis builds principally from the work of Holmes Rolston and of

H. Richard Niebuhr. Thesis advisors were Howard Harrod and Peter Paris. (v5,#1)

Reitan, Eric H., "Deep Ecology and the Irrelevance of Morality," Environmental Ethics 18(1996):411-424. Both Arne Naess and Warwick Fox have argued that deep ecology, in terms of 'Self-realization,' is essentially nonmoral. I argue that the attainment of the ecological Self does not render morality in the richest sense 'superfluous,' as Fox suggests. To the contrary, the achievement of the ecological Self is a precondition for being a truly moral person, both from the perspective of a robust Kantian moral framework and from the perspective of Aristotelian virtue ethics. The opposition between self-regard and morality is a false one. The two are the same. The ecological philosophy of Naess and Fox is an environmental ethic in the grand tradition of moral philosophy. Reitan teaches philosophy, Pacific Lutheran University, Tacoma, WA. (EE)

Reitan, Eric, "Private Property Rights, Moral Extensionism and the Wise-Use Movement: A Rawlsian Analysis," Environmental Values 13(2004):329-347. Efforts to protect endangered species by regulating the use of privately owned lands are routinely resisted by appeal to the private property rights of landowners. Recently, the 'wise-use' movement has emerged as a primary representative of these landowners' claims. In addressing the issues raised by the wise-use movement and others like them, legal scholars and philosophers have typically examined the scope of private property rights and the extent to which these rights should influence public policy decisions when weighed against other moral considerations. Whether from an anthropocentric standpoint or from a perspective of moral extensionism, the key question seems to be the extent to which prima facie property rights are overridden by other moral interests, not whether such rights claims can reasonably be appealed to at all in public discussions of environmental justice. I argue, however, that a morally extensionist perspective not only introduces more potential defeaters of prima facie property rights, but actually strips appeals to private property rights of their moral significance. Hence, I argue on Rawlsian grounds that appealing to private property rights in the way that the wise-use movement does is unreasonable in a pluralistic society. In so doing, I show that a Rawlsian perspective may be more congenial to the interests of moral extensionists than is typically thought. Reitan is in philosophy, Oklahoma State University, Stillwater, OK. (EV)

Renner, Rebecca, "Conflict Brewing over Herbicide's Link to Frog Deformities," Science 298(1 November 2002):938-938. Is the use of atrazine related to the decline of amphibians, turning male frogs into hermaphrodites? Earlier experiments suggested yes, but later experiments are more inconclusive. (v.13,#4)

Rensenbrink, John. The Greens and the Politics of Transformation. Reviewed in Environmental Ethics 15(1993):185-90.

Renzong, Qiu, editor-in-chief, Guowai Ziranxue Zhexueweni 1990 (International Philosophical Problems in Natural Science 1990), Chinese Academy of Social Sciences, Institute of Philosophy. Beijing: Social Science Press, 1991. ISBN 7-5004-0885-4/B 181. There are section introductions, but all the articles are translations from Western books and journals. Section I is on Philosophy of Science: Scientific Materialism. Section II is on Science and Society: The Relationship between Human Beings and Nature. The section editor is Yu Mouchang, Institute of Philosophy, who gives an introduction to environmental ethics, "Current Focus of the Study of the Relationship between Human Beings and Nature." The section contains three articles (1) G. A. Davedova, "Problems of the Relationship between Human Beings and Nature in Marxist Historical Philosophy" (pp. 104-129, translated from Russian; (2)

M. B. Kushkova, Human Beings and Nature (pp. 130-145, translated from Russian; (3) Holmes Rolston, III, "Is There an Ecological Ethic? (pp. 146-157, translated by Ye Ping (Northeast Forestry University, Harbin) from English in Philosophy Gone Wild, originally in Ethics. Section III is on Philosophical Problems of Nature: the Self-Organization of Nature. It contains a dozen articles, for example Ilya Prigogine on irreversible thermodynamics and several articles inquiring how evolutionary creation has taken place through the self-organization of nature. In China, this book has sold well, though many books of this kind in China are as much "distributed" to libraries and agencies as sold. Already about 3000 copies have been sold or distributed. (China)

Repetto, Robert, "Accounting for Environmental Assets," Scientific American 266 (no. 6, June):94-100. A country can cut down its forests, erode its soils, pollute its aquifers, and hunt its wildlife to extinction, but its measured income is not affected as these assets disappear. Impoverishment is taken for progress. Repetto is with the World Resources Institute in Washington, formerly a professor of economics at Harvard University. (v3,#3)

Repetto, Robert, Rothman, Dale S., Faeth, Paul, Austin, Duncan. Has Environmental Protection Really Reduced Productivity Growth? Washington, D.C.: World Resource Institute, 1996. 46pp. \$14.95 paper. This report shows how the conventional measure of productivity growth misrepresents the industrial process by taking into account only pollution abatement costs and ignoring pollution damages averted. (v8,#1)

Repetto, Robert, compiler, The "Second India" Revisited. Washington, DC: World Resources Institute, 1994. \$ 14.95 paper. 90 pages. A study produced by a team of nine Indians and others. The "Second India" is the near doubling of the population of India in the last twenty years. The much-admired green revolution in agriculture, coupled with a quadrupling of the rate at which contraceptives are used, has enabled India to do little more than mark time in per capita food production in the last twenty years. Though parts of India, where women have better education and higher status, have reduced births to the replacement rate, in much of India the rate is over five births per woman. Population is still increasing, and India's population is projected to exceed that of China in the next century. There is no foreseeable method of continuing the green revolution to feed such population growth. Also, the increased food production has come at considerable environmental degradation. Repetto is a senior economist at the World Resources Institute.

Repetto, Robert. Jobs, Competitiveness, and Environmental Regulation: What are the Real Issues? Washington, D.C.: World Resource Institute, 1995. 60pp. \$12.95 paper. Repetto shows how greater use of market incentives in regulatory policy, reduction of economically unwarranted subsidies, better use of cost-benefit analysis in regulatory decision-making, and other measures could help the United States protect the environment with far greater economic efficiency. (v8,#1)

Rescher, Nicholas, Complexity: A Philosophical Overview. Somerset, NJ: Transaction Publishers, 1998. The world is enormously sophisticated and nature's complexity is literally inexhaustible. As a result, projects to describe and explain natural science can never be completed. The nature of complexity and its bearing on our world and how we manage our affairs within a socially, technologically, and cognitively complex environment with vast management problems and risks of mishap. "Technological escalation" is a sort of arms race against nature in which scientific progress requires more powerful technology for observation and experimentation, and, conversely, scientific progress requires the continual enhancement of technology. The increasing complexity of science and technology means problems growing faster than solutions, and major management and decision problems. Rescher is in philosophy at the University of Pittsburgh. Retallack, Simon, "God Protect Us from Those Who 'Protect the Skies.'" The Ecologist. 27 (Sept. 1997):188-. The Montreal Protocol celebrated its tenth anniversary last September. Initially hailed as a landmark in environmental protection, what actually emerged was an agreement as ridden with holes as the ozone layer it was designed to protect. (v.8,#4)

Reuther, Rosemary Radford. *Integrating Ecofeminism, Globalization, and World Religions*. Lanham, MD: Rowman & Littlefield, 2004. Economic conflicts, polarization of corporate globalization, conflicts based on religious identities, ecological degradation, and the possibilities for a different world order. The importance of gender in shaping the present crisis. The importance of religious orientations in its solution.

Reuther, Rosemary Radford, Gaia and God: An Ecofeminist Theology of Earth Healing. San Francisco: Harper and Row, 1992. \$ 22.00, hardcover. "Ecological healing is a theological and psychic-spiritual process." "Classical traditions did not only sacralize patriarchal hierarchy over women, workers, and the earth. They also struggled with what they perceived to be injustice and sin and sought to create just and loving relations between people in their relation to the earth and to the divine. Some of this effort to name evil and struggle against it reinforced relations of domination and created victim-blaming spiritualities and ethics. But there are also glimpses in this heritage of transformative, biophilic relationships. These glimpses are a precious legacy that needs to be separated from the toxic waste of sacralized domination." "A healed relation to each other and to the earth calls for a new consciousness, a new symbolic culture and spirituality" (Introduction). Reuther does not want either a male God or a female Gaia. Reuther is professor of theology at Garrett-Evangelical Theological Seminary. (v3,#4)

Reuther, Rosemary Radford, Gaia and God: An Ecofeminist Theology of Earth Healing. San Francisco: Harpers, 1992. 288 pages. \$ 22.00 cloth. Reuther sifts through the legacy of the Christian and Western cultural heritage to critique beliefs and stories that have negatively influenced our relationships with each other and with the Earth. "A healed relation to each other and to the earth calls for a new consciousness, a new symbolic culture and spirituality." "We must see the work of ecojustice and the work of spirituality as interrelated, the inner and outer aspects of one process of conversion and transformation." John Cobb says, "Reuther brings her encyclopedic knowledge of the history of human life on this planet to bear on questions more often treated in sweeping generalizations. ... This is Christian theology at its best: tough-minded, convincing, and dealing with matters of utmost importance." (v3,#3)

ReVelle, Penelope, and Charles ReVelle, The Global Environment: Securing a Sustainable Future. Boston: Jones and Bartlett, 1992. Cloth. 480 pages. Designed as a text. Part I. Ecology: The Background. Part II. Human Population Issues. Part III. Land and Wildlife. Part IV. Energy Resources and Recycling. Part V. Air and Water Resources. Part VI. Sustainable Global Societies. With two dozen box essays by guest authorities. A sample: Paul D. Raskin, "Sustainability and Equity." The authors are at Johns Hopkins University. (v5,#1)

Revesz, Richard L. Foundations of Environmental Law and Policy. New York: Oxford University Press, 1996. 352pp. \$19.95 paper, \$45 cloth. A collection of 40 readings by lawyers, economists, environmentalists, and legal scholars, which introduce students to the major theoretical approaches in the field. A companion volume to case materials for use as a textbook for environmental law policy. (v8,#1)

Revesz, Richard L., Foundations of Environmental Law and Policy, Oxford Press

Revkin, Andrew C., "A Far-Reaching Fire Makes a Point About Pollution," New York Times, July 27, 2004, D1. Fires in Alaska have dropped soot on Louisiana. Satellites are revealing much wider distribution of air pollutants than earlier supposed. (v. 15, # 3)

Revkin, Andrew C., "New Research Questions Uniqueness of Recent Warming," New York Times, October 5, 2004, p. D2. New research, or at least new methods of analysis of old data, suggest that there has been more global warming at times in the last 1,00 years than previously thought. But the research does not challenge the claim that the present global warming is human caused. (v.14, #4)

Revkin, Andrew, "Bush Offers Plan for Voluntary Measures to Limit Gas Emissions," New York Times (2/15/02): A6 and Suzanne Daley, "Europeans Give Bush Plan on Climate Change a Tepid Reception," New York Times (2/15/02): A6. Bush's global warming plan. In March of 2001, U.S. President George Bush rejected the international treaty (known as the Kyoto Protocol) aimed at cutting CO2 emissions to 1990 levels by 2012, a treaty that has been agreed to (although not yet ratified) by almost every other industrial power and developing country. Bush had argued that the treaty would burden the U.S. economy "throwing millions of U.S. citizens out of work" and that it unfairly exempted major developing countries from reductions. The U.S. is the single largest producer of greenhouse emissions, generating 20% of the total. Now the Bush Administration has announced that it would respond to concerns about global warming with voluntary measures aimed at slowing the rate of growth in CO2 emissions, while letting their total amount continue to rise. This voluntary approach would be encouraged by \$4.6 billion in tax credits for renewable energy sources and use of more efficient cars, and by future emission trading incentives. According to President Bush, "My approach recognizes that economic growth is the solution, not the problem"--for a thriving economy is necessary to build the wealth necessary to improve conditions on the planet. A French climate change official argued that the Bush proposal showed that the U.S. wanted change "at no cost and in a way that would not in any way challenge the American lifestyle and

especially its consumption." He also worried that the Bush approach will destabilize support for the Kyoto pact as countries less rich than the U.S. wonder why they should act forcefully when the U.S.'s approach is so modest. (v.13,#1)

Revkin, Andrew C., "Report to Endorse Expanding Forests To Fight Global Warming," New York Times, Feb. 16, 2001, p. A1, A5. Scientists endorse expanding forests and buying and selling credits to fight global warming. The Intergovernmental Panel on Climate Change is endorsing two strategies that have been points of contention between the U.S. and Europe in efforts to complete a climate treaty. The panel concludes that by protecting existing forests and planting new ones, countries could blunt warming by sopping up 10-20 percent of the heat-trapping carbon dioxide. Also the cost to industrialized countries could be cut in half if they were allowed to buy and sell credits earned by those that make the deepest reductions in carbon dioxide and other greenhouse gases. (v.12,#3)

Revkin, Andrew, "Hunting for Oil: New Precision, Less Pollution" New York Times (01/30/01): D1. New oil-drilling techniques that are environmentally less harmful. With the ongoing debate over whether to drill for oil in the Arctic National Wildlife Refuge, it may be useful to understand some of the new oil discovery and extraction technologies touted by industry as environmentally friendly. Instead of peppering the surface with wells over a broad area, new supercomputer simulations of the deep earth and new drilling equipment allow wells to be constructed on small gravel pads with drills branching out underground for four or five miles following thin layers containing oil. Instead of waste pits that overflow with drilling mud, contaminated water, spilled oil, and discarded chemicals, waste, garbage, and rock cuttings can now be ground into a slurry and pumped into the ground 2000 feet beneath the 2000 foot-thick permafrost. Roads that were once built of gravel mined from river beds and that spread far and wide on the fragile tundra can now be built from ice (either from water pumped from tundra ponds or from ice scraped from ponds and laid down like gravel). Ice roads melt away in the spring thaw and leave few traces. Even the maze of pipelines which are an unavoidable means of collecting the oil can be raised to allow animals to duck underneath and are punctuated with elevated elbows so that less oil is spilled if one section is punctured. Both sides agree that the new surveying techniques are a mixed blessing environmentally. Although no longer using dynamite, the new three-dimensional seismic technology that performs ultrasound on the earth involves the use of vibrating 10-ton vehicles that do not travel on ice roads but crisscross the open tundra in a much more intensive way than with the old surveying techniques. Scars are left on the tundra and there is a greatly increased chance of encountering and disrupting wildlife. The new surveying techniques have raised the success rate from 1 producing well for each 10 exploratory wells to 5 in 10. One environmental critic responding to the elaboration of these new technologies says that once the work shifts from exploration to extraction of oil, the result is always a sprawl of pipelines, roads, crew quarters, and fuel depots: "In the end, even with all this technology, you've got a massive industrial complex."

Revkin, Andrew, The Burning Season: The Murder of Chico Mendes and the Fight for the Amazon Rain Forest (Houghton Mifflin, 1990, \$ 19.95). Chico Mendes was a Brazilian frontier union leader, an organizer of a national federation of wild rubber tappers in the state of Acre. He came to the United States and England to promote the conservation of the forests, which the rubber tappers wish to maintain as "extractive reserves," a battle fought against land speculators who were burning down immense stretches of forest. The wild rubber trees grow scattered in the primary forest, but this requires 700 acres to obtain an amount of latex that can be gotten from a single acre of planted rubber, especially from planted Asian rubber. Mr. Mendes was murdered in December 1988, one of several hundred activists killed in Brazil that year. Subsequently there has been much interest in him as a martyr for both the cause of the poor and environmental conservation. (v1,#3)

Revkin, Andrew C., "Save the Whales! Then What?" New York Times, August 17, 2004, p. D1, D4. Some whale species have recovered well. Pressure is building to resume hunting of whales like the

plentiful minke, and international regulators are negotiating quotas and rules. (v. 15, # 3)

Revkin, Andrew C., "A Message in Eroding Glacial Ice: Humans Are Turning Up the Heat," New York Times, Feb. 12, 2001, p. A1, A4. Kilimanjaro's icecap is on a hasty retreat, at a pace such that the snows of Kilimanjaro will disappear in fifteen years. Snow and ice on tropical alpine mountains is disappearing fastest of all, though this is retreating from Montana to Mount Everest to the Swiss Alps. Scandinavia seems to be an exception, apparently because shifting storm tracks in Europe are dumping more snow there. Various adverse effects on people and wildlife. (v.12,#3)

Revkin, Andrew C., "Big Arctic Perils Seen in Warming," New York Times, Saturday, October 30, 2004, p. A1, p. A3. An eight nation survey finds that wildlife is at risk. Environmental alarms for a region that may not be able to adapt. Also sea levels will rise around the world. The survey involved 300 scientists, as well as elders from the native communities in the region. (v.14, #4)

Revkin, Andrew W., "Report Tallies Hidden Costs of Human Assault on Nature," New York Times, April 5, 2005, p. D2. The United Nations Millennium Ecosystem Assessment, now released, is a sweeping report that measures damage not so much to nature itself but to the things nature does for people. More than 1,300 ecologists and other researchers from 95 countries participated. The report is generally bleak and alarming, although it recognizes some successes. Sixty percent of ecosystem services to humans have been degraded by human activities, both through direct actions like overfishing and through indirect ones, like the tendency of deforestation to raise the risk of floods.

Many of the regions where such natural assets are being most rapidly degraded are also the world's poorest, compounding the problems to stem poverty, disease, and hunger in developing countries. Wealthy countries are also contributing greatly to some problems, for example in nitrogen runoff that disrupts coastal waters or in global warming. Tropical forests are being degraded, but the report also highlights arid areas, such as sub-Saharan Africa, where drought, combined with ever-growing populations and demands for water, has contributed to recent social upheavals and bloodshed in Sudan. A lead author of the report is Harold A. Mooney, biologist at Stanford University. The report is online at: www.millenniumassessment.org

Revkin, Andrew, "A West African Monkey Is Extinct, Scientists Say," New York Times (9/12/00): A20. Primate goes extinct. For the first time in several centuries a member of the primate order—the taxonomic group to which humans belong—has become extinct. Miss Waldron's red colobus, a loud-mouthed, red-cheeked monkey from the rainforest of Ghana and Ivory Coast has not been seen since the 1970s and a seven-year effort to visit every remaining piece of its habitat ended without finding any evidence of its presence. Biologists fear that this is the beginning of a stream of extinctions of West African primates and other wildlife. Fragmentation of forests by roads and logging leaves isolated islands of animals that are then easily trapped or shot by hunters supplying the lucrative trade in bush meat that ends up in urban restaurants. (v.11,#4)

Revkin, Andrew C., "China Is Bright Spot in Dark Report on the World's Diminishing Forests," New York Times, November 15, 2005. Widespread tree planting in China has slowed the rate at which the Earth's forested area is dwindling, but the clearing of tropical forests, much of it in areas never previously cut, continues to grow, according to a new United Nations Report. The study is published by the UN Food and Agriculture Organization (FAO) and is online at:

fao.org/forestry

China's new forest policy has resulted in a turnaround, from a loss of about 3,000 square miles of forest a year in the 1990's to a gain of about 4,000 square miles annually since 2000. See also Global Forest Watch:

globalforestwatch.org

Revkin, Andrew C., "No Escape: Thaw Gains Momentum," New York Times, October 25, 2005. All the

computer modelling predicts sea-ice will largely disappear under global warming by 2050, though some models predict this can be with erratic warming and cooling in some regions. Melting of the Greenland ice cap has become a major concern. Although the ice cap has grown a little thicker, due to recent increase in snowfall, the edges of the icecap are melting faster, with net loss. That ice cap contains as much water as is in the Gulf of Mexico, and melting would raise sea levels worldwide more than twenty feet.

Revkin, Andrew C., "Eavesdropping on Secrets of Elephant Society," New York Times, January 9, 2001, pp. D1, D4. Reporting the work of Katharine Payne, Bioacoustics Research Program, Cornell Laboratory of Ornithology, on low frequency elephant communication. She concludes: "Our hope is to get out of our own minds a little bit and into the minds of these amazing animals. ... They are at least as emotional and as attached to family members as human beings are. They are very much aware of the experience of others." (EE v.12,#1)

Revkin, Andrew, "New Studies Warn of Effects of Melting Polar Ice," New York Times. 23 March 2006. <http://www.nytimes.com/2006/03/23/science/23cndmelt.html>.

According to new observations and analysis by teams of scientists, the growing human influence on earth's climate could lead to an irreversible rise in sea levels by eroding Earth's vast polar ice sheets. One team used computer models of climate and ice and found that about 2100, average temperatures could be 4 degrees warmer. However, many experts say there are still uncertainties about timing, extent and causes.

Revkin, Andrew C., "Antarctic Glaciers Quicken Pace to Sea; Warming is Cited," New York Times, September 24, 2004. Warmer coastal air and water have accelerated the melting of Antarctica's ice shelves and increased the flow of glaciers into the sea. Some of the warming may be natural; some of it is human-caused. Similar shifts have been measured in the Arctic. (v.14, #4)

Revkin, Andrew C. "Arctic Melt Unnerves the Experts." *New York Times* (October 2, 2007). Reprinted with further commentary in *The Polar Times* Vol. 3, no. 12 (January 2008) 3-5. Scientists were astonished by the shrinking of the Arctic ice cap during the summer of 2007, unparalleled in over a century. One million square miles (six Californias) of open water appeared beyond the average since satellites made possible accurate measurements in 1979. Warming and also winds that pushed freed ice further south were responsible. One result is that the north polar nations of Russia, Canada, Denmark, Norway, Finland, and the United States have started making claims about military control, shipping routes, fishing rights, and mineral rights to what lies under the Arctic Ocean. Russia has planted a capsule with a flag at 13,200 feet beneath the (still frozen) surface at the North Pole, claiming that the Lomonosov Ridge beneath is an extension of its continental shelf and that the 460,000 square miles of resource-rich Arctic waters fall under the Kremlin's jurisdiction. See also "Water Wrestling" by Moki Kokoris (*The Polar Times* Vol. 3, no. 12 (January 2008): 6).

Revkin, Andrew. "Poorest Nations Will Bear Brunt as World Warms." *New York Times* (April 1, 2007): 1, 6. While wealthy countries spend billions on themselves in preparation for global warming, they spend only millions on other nations, the latter of whom will bear the most damage from drought and rising sea levels caused by the wealthy nations.

Rice, Robert A. "Noble Goals and Challenging Terrain: Organic and Fair Trade Coffee Movements in the Global Marketplace." Journal of Agricultural and Environmental Ethics 14(2001):39-66. Social relations associated with conventional agricultural exports find their origins in long term associations based on business, family, and class alliances. Working outside these boundaries presents a host of challenges, especially where small producers with little economic or political power are concerned. Yet, in many developing countries, alternative trade organizations (ATOs) based on philosophies of social justice and/or environmental well-being are carving out spaces alongside traditional agricultural export sectors by establishing new channels of trade and marketing. Coffee provides a case in point, with the fair trade and certified organic movements making inroads into the market place. In their own ways, these movements represent a type of economic and social restructuring from below, drawing upon and developing linkages beyond the traditional boundaries of how coffee is produced and traded. An examination of the philosophies of the fair trade and organic coffee movements reveal that the philosophical underpinnings of both certified organic and fair-trade coffee run counter to the historical concerns of coffee production and trade. Associations of small producers involved in these coffees face

stiff challenges - both internal and external to their groups. More work, especially in "situ" fieldwork aimed at uncovering the challenges, benefits, tensions, and successes, is needed to understand better the ways these networks operate in the dynamic agro-food complex. Keywords: Alternative trading organizations. certified organic, coffee, fair trade. Rice is at the Smithsonian Migratory Bird Center National Zoological Park, Washington, D.C. (JAEE)

Rich, Catherine, and Travis Longcore, eds., *Educational Consequences of Artificial Night Lighting*. Washington, DC: Island Press, 2005. Contributors explore the dark side of lighting up the night, "photopollution." Lights confuse many animals, for example they disorient sea turtle hatchlings. They disorient many nocturnal animals that use only the rod system for night vision, and bright lighting saturates their retinas. Upward of half of all Americans live in locations where it does not become sufficiently dark for the human eye to complete the transition from cone to rod vision. Hundreds of thousands of nocturnal bird migrants are killed each year by aircraft warning lights on towers, a situation that could be much improved if red lights, which disorient birds, were replaced with white lights, which reduce the disorienting. The editors run the Urban Wildlands Group, a nonprofit conservation organization in Los Angeles.

Richards, Roberta M., How Should We Think About Loggers and Owls? Principles for an Applied Environmental Ethic, Ph. D. thesis at the University of Southern California, School of Religion, May 1994. Our dominant moral traditions, rooted in anthropocentrism, offer little guidance about how to resolve public policy conflicts when these involve the balancing of human and extra-human goods. Richards develops a theory grounded in process theologian John Cobb's "rich experience" conception of value; one ought to maximize rich experience. She develops nine moral principles for achieving this goal. These can be used generally in environmental conflicts, but are here specifically applied to the conservation of endangered species, and, more specifically still, to the loggers versus owls crisis that has paralyzed the Pacific Northwest. Richerson, Peter J., "Ecology and Human Ecology: A Comparison of Theories in the Biological and Social Sciences," *American Ethnologist* 4(no. 1, Feb. 1997):1-26. Ecology has been used frequently by social scientists as a source of theoretical models, and biological ecologists have often applied their theory to human populations. Several problems have attended these cross-disciplinary enterprises, including inappropriate uses of teleological models and a failure by both biologists and social scientists to understand the theoretical implications of culture and technology for ecological models. Attention to these problems will increase the applicability of ecological theories in the social sciences. Richerson is at the University of California, Davis.

Richter, Judith. "'Vaccination' Against Pregnancy: The Politics of Contraceptive Research." *The Ecologist* (1979)26(Mar.1996):53. For the past 25 years, scientists have been researching a new birth control method--an immuno-contraceptive--which aims to turn the body's immune system against the reproductive system. Some researchers doubt whether the method will actually prevent pregnancy without severe health risks. Analysis of the method suggests that research has been motivated by the goal of developing an easy means of "population control."

Ridder, Ben, "An Exploration of the Value of Naturalness and Wild Nature," *Journal of Agricultural and Environmental Ethics* 20(2007):195-213. The source of the value of naturalness is of considerable relevance for the conservation movement, to philosophers, and to society generally. However, naturalness is a complex quality and resists straightforward definition. Here, two interpretations of what is "natural" are explored. One of these assesses the naturalness of species and ecosystems with reference to a benchmark date, such as the advent of industrialization. The value of naturalness in this case largely reflects prioritization of the value of biodiversity. However, the foundation of our understanding of naturalness is that it describes processes that are free of human intervention. Conflict between the two interpretations of naturalness is apparent in the claim that naturalness can be enhanced by human intervention, in the form of ecological restoration. Although naturalness in its purest form precludes human intervention, some human activities are also apparently more natural than others. This continuum of naturalness relates to the autonomy of the individual from abstract instrumentalism, which describes a particular form of influence ubiquitous in contemporary society. The value of naturalness reflects both dissatisfaction with these threats to personal autonomy, and respect for wild nature as the embodiment of a larger-than-human realm. Keywords: abstract instrumentalism - autonomy - naturalness - rational agency - values. Ridder is at School of Geography and Environmental Studies, University of Tasmania, Hobart, Tasmania, Australia.

Ridley, Matt, The Origins of Virtue. London: Penguin Books, 1997. Chapter 11 is on "Ecology as Religion," where Ridley, following the prevailing biological theory of humans as always self-interested, dislikes any Romanticism, especially about aboriginal peoples, since peoples ancient and modern always act selfishly if they can get by with it, although they are also evolved to cooperate in their own self-interest. "The conclusion that seems warranted is that there is no instinctive environmental ethic in our species--no innate tendency to develop and teach restrained practice. Environmental ethics are therefore to be taught in spite of human nature, not in concert with it. They do not come naturally. We all knew that anyway, did we not? Yet we persist in hoping that we'll find an ecological noble savage somewhere inside our breast. ... He's not in there." (p. 225)

The book concludes (Chapter 10, The Gains from Trade, and Chapter 12, The Power of Property) with a defense of free markets property rights. "Wherever you look, the reason for the environmental troubles in the Third World turns out to be caused by the lack of clear property rights. ... The poverty of the Third World is to be cured largely by creating secure property rights." (pp. 238-239). "Private property is often the friend of conservation, government regulation is often the enemy" (p. 243). "If we are to recover social harmony and virtue, if we are to build back into society the virtues that made it work for us, it is vital that we reduce the power and scope of the state" (p. 264). Government regulations and participatory democracy require too much faith in the common good. A good example of scientism, elevating a biological theory into a comprehensive worldview, including politics, getting Thatcherite politics and free market environmentalism out of selfish genes. (v.8,#4)

Ridley, Matt, Down to Earth: A Contrarian View of Environmental Problems. London: Institute of Economic Affairs, 1995. 80 pages. Some claims:

1. World population growth is decelerating; food, oil and copper are all cheaper and more abundant than ever before.
2. Global temperatures may actually be falling, according to satellite sensors.
3. The ozone layer is getting thicker, not thinner, over temperate latitudes.
4. Winter sown corn, not pesticide use, is responsible for the decline of songbirds on farmland.

5. Some scientists say 20 per cent of species will be extinct in 30 years, yet the actual extinction rate of birds and mammals is 0.00008 per cent a year.
6. Big-game hunters are the best hope for the survival of Africa's wildlife outside a few well-financed national parks.
7. Environmental lobbying organisations are spending more money on lawyers and marketing men to grow their own budgets and less on naturalists and volunteers.
8. Forty per cent of all tress in Britain belong to the government, whose record of mismanagement of forest ecology, public access and finance is second to none.
9. Government conservation schemes are too defensive; their some aim is to protect rich habitats rather than to improve impoverished ones.
10. Exaggeration, nationalisation and central planning are the enemies of the environment, not the allies." (See back cover.)

Ridley is a former zoologist at Oxford University, now a science writer, also a self-appointed iconoclast. A disciple of Richard Dawkins, he derives virtue from selfish genes in The Origins of Virtue (Penguin, 1997), from which he also derives free market environmentalism and Thatcherite politics. Rippe, Klaus Peter and Peter Schaber. "Democracy and Environmental Decision-Making." Environmental Values 8(1999):75-88. ABSTRACT: It has been argued that environmental decision-making can be improved by introducing citizen panels. The authors argue that citizen panels and other models of citizen participation should only be used as a consulting forum in exceptional cases at the local level, not as a real decision-making procedure. But many problems in the field of environmental policy need nonlocal, at least regional or national, regulation due to the fact that they are of national importance. The authors argue that there are good reasons not to institutionalise national citizen panels. They advocate the view that more reasonable and more competent solutions can be found by introducing forms of direct democracy. KEYWORDS: Participation, citizen panels, consensus conferences, democracy. Klaus Peter Rippe and Peter Schaber, University of Zurich Ethik-Zentrum Zollikerstr. 117, 8008 Zurich, Switzerland. (EV)

Ripple, W. J. and Beschta, R. L., "Wolves and the Ecology of Fear: Can Predation Risk Structure Ecosystems?" BioScience 54(no. 8, 2004): 755-766(12). We investigated how large carnivores, herbivores, and plants may be linked to the maintenance of native species biodiversity through trophic cascades. The extirpation of wolves (*Canis lupus*) from Yellowstone National Park in the mid 1920s and their reintroduction in 1995 provided the opportunity to examine the cascading effects of carnivore herbivore interactions on woody browse species, as well as ecological responses involving riparian functions, beaver (*Castor canadensis*) populations, and general food webs. Our results indicate that predation risk may have profound effects on the structure of ecosystems and is an important constituent of native biodiversity. Our conclusions are based on theory involving trophic cascades, predation risk, and optimal foraging; on the research literature; and on our own recent studies in Yellowstone National Park. Additional research is needed to understand how the lethal effects of predation interact with its nonlethal effects to structure ecosystems. (v.14, #4)

Ripple, William J; Beschta, Robert L, "Wolves and the Ecology of Fear: Can Predation Risk Structure Ecosystems?" BioScience 54 (no. 8, 1 August 2004):755-766(12). We investigated how large carnivores,

herbivores, and plants may be linked to the maintenance of native species biodiversity through trophic cascades. The extirpation of wolves (*Canis lupus*) from Yellowstone National Park in the mid-1920s and their reintroduction in 1995 provided the opportunity to examine the cascading effects of carnivore-herbivore interactions on woody browse species, as well as ecological responses involving riparian functions, beaver (*Castor canadensis*) populations, and general food webs. Our results indicate that predation risk may have profound effects on the structure of ecosystems and is an important constituent of native biodiversity. Our conclusions are based on theory involving trophic cascades, predation risk, and optimal foraging; on the research literature; and on our own recent studies in Yellowstone National Park. Additional research is needed to understand how the lethal effects of predation interact with its nonlethal effects to structure ecosystems.

Ripple, WJ; Beschta, RL, "Linking Wolves and Plants: Aldo Leopold on Trophic Cascades," BioScience 55 (no. 7, July 2005): 613-621. Aldo Leopold, perhaps best known for his revolutionary and poignant essays about nature, was also an eloquent advocate during the 1930s and 1940s of the need to maintain wolves and other large carnivores in forest and range ecosystems. He indicated that their loss set the stage for ungulate irruptions and ecosystem damage throughout many parts of the United States. We have synthesized the historical record on the potential effects of wolf extirpation in the context of recent research. Leopold's work of decades ago provides an important perspective for understanding the influence of large carnivores, via trophic cascades, on the status and functioning of forest and range plant communities. Leopold's personal experiences during an era of extensive biotic changes add richness, credibility, and even intrigue to the view that present-day interactions between ungulates and plants in the United States have been driven to a large degree by the extirpation of wolves and other large carnivores.

Rivera-Monroy, Victor H et al., "A Conceptual Framework to Develop Long-Term Ecological Research and Management Objectives in the Wider Caribbean Region", BioScience 54(no.9, 1 September 2004):843-856(14). The Caribbean Sea and its watersheds show signs of environmental degradation. These fragile coastal ecosystems are susceptible to environmental impacts, in part because of their oligotrophic conditions and their critical support of economic development. Tourism is one of the major sources of income in the Caribbean, making the region one of the most ecotourism dependent in the world. Yet there are few explicit, long-term, comprehensive studies describing the structure and function of Caribbean ecosystems. We propose a conceptual framework using the environmental signature hypothesis of tropical coastal settings to develop a series of research questions for the reef-sea-grass-wetland seascape. We applied this approach across 13 sites throughout the region, including ecosystems in a variety of coastal settings with different vulnerabilities to environmental impacts. This approach follows the strategy developed by the Long Term Ecological Research program of the National Science Foundation to establish ecological research questions best studied over decades and large spatial areas.

Roach, Catherine M., Tim I. Hollis, Brian E. McLaren, Dean L. Y. Bavington, "Ducks, Bogs, and Guns: A Case Study of Stewardship Ethics in Newfoundland," Ethics and the Environment 11(2006):43-70. Three major strategies exist for the protection of endangered habitat and species: (1) land acquisition programs, (2) government legislation and regulatory agencies, and (3) "stewardship" programs that are voluntary and community-based. While all of these strategies have merit, we suggest that stewardship holds particular advantages and should be considered more often as a strategy of first choice. In this article, we examine the Municipal Wetland Stewardship program of Newfoundland, a popular and successful Canadian policy for the local protection of wetlands. Important issues are at stake: competing philosophical foundations for managerial ecology, the value of "local ecological knowledge," principles of community-based conservation, the question of whether stewardship empowers local communities or controls them from afar, and ethical conflicts around American colonialism, hunting, and ecotourism. The results suggest that despite some potentially problematic ironies, the Newfoundland program provides a model for a public policy aimed both at the pragmatics of biophysical sustainability and at the ideals of environmental ethics, social justice, and democratic politics. Roach is in religious studies, University of Alabama, Tuscaloosa; Hollis is in geography, University of Newfoundland; McLaren is in wildlife, Lakehead University, Faculty of Forestry. Bavington is in ecology at the University of Michigan. (Eth&Env)

Robbins, Jim, "The Microbe Miners," Audubon 96 (no. 6, November-December, 1994):90-95. More on the hunt in Yellowstone for thermophilic bacteria, whose enzymes are proving of great value in the polymerase chain reaction (PCR) techniques used in DNA genetic fingerprinting, a process once sold for \$ 300 million, and now earning \$ 100 million a year. While such technological processes can be protected by patent, the question remains whether any royalties are due to Yellowstone Park, or to the U. S. government, or to anybody, for such prospecting, or whether microbes are a common good. Exobiologists are also interested, since the thermophiles are thought to be similar to primitive forms of life, and what is learned in Yellowstone might be used to detect life in space. Robbins is a Montana environmental writer. (v5,#4)

Robbins, Jim, "Engineers Plan to Send a River Flowing Back to Nature," New York Times, May 12, 1998, B9, B11. The Snake River near Jackson, Wyoming, was engineered for the better, to facilitate spring runoff and allow million dollar housing developments, only the results were worse instead. The river's ecology was dramatically altered, leaving long stretches of riverbank nearly barren. Now the Corps of Engineers hopes to put the river, to some extent at least, back like it was. (v9,#2)

Robbins, Jim, "Hunting Habits of Wolves Change Ecological Balance in Yellowstone," New York Times, October 18, 2005. Wolves have been back in the park for ten years, and this "apex predator" has caused "a trophic cascade." Elk are fewer and more wary, and feed more in the open, less in willow thickets, or among the cottonwoods and aspens, which have bounced back. There are fewer coyotes, but this means more foxes, more mice. Also from the leftover wolf kills, there is more food for other carnivores and scavengers. Alas, however, a big fear is from people, or, more accurately, from people's dogs, from which the wolves catch parvovirus. That has been killing 60-70 percent of the wolf pups. See also Smith, Douglas W., and Gary Ferguson, Decade of the Wolf: Returning the Wild to Yellowstone.

Robert, Jason Scott. "Wild Ontology: Elaborating Environmental Pragmatism." Ethics and the Environment 5(2000):191-210. ABSTRACT: I elaborate and critically evaluate the theses of "environmental pragmatism," especially as captured in a recent collection with that title. While I am hopeful about this new approach, I want nonetheless to make reparations for its shortcomings. The primary difficulty is that environmental pragmatist tend to express only implicitly the metaphysical commitments of, say, Wiilliam James, and yet the claims of environmental pragmatism would be profoundly strengthened by direct appeal to James' metaphysics. The ecosystem approach is particularly amenable to characterization in terms of pragmatic metaphysics. Thus, I offer the thesis of wild ontology in an effort to enrich the empirical basis of environmental philosophy, and also to help cure environmental ethics of its political impotence. (E&E)

Roberts, Paul Craig. "Quietly, Now, Let's Rethink the Ozone Apocalypse." Business Week, June 19, 1995, p. 26. Studies that show CFS's are not to blame for holes in the ozone have lawmakers questioning the coming ban on production. An unproven theory of ozone depletion is imposing heavy costs on the global economy. The scientific facts clearly indicate that there is no observational evidence that CFC's are thinning the ozone layer, and even if they did, the additional ultraviolet that would be let through is not the kind that causes cancer. The ozone threat is baseless hysteria. Roberts is in political economy at the Cato Institute, Washington. (v6,#3)

Roberts, Roxanne, "Wedding Day Butterflies," Washington Post (5/20/98): D2. According to a social life columnist for the Washington Post, the latest trend in "environmentally correct marriage" is the live butterfly display. Instead of throwing rice (which she says is bad for birds), guests release monarch or painted lady butterflies. For four dollars apiece, companies provided butterflies individually in small boxes with air holes. Each guest is given a box with instructions to open it at a specific time. The result is a "romantic, picture-perfect moment," unless of course the butterflies are dead, which sometimes happens. Some hire "butterfly handlers" to ensure success. The columnist suggests that throwing birdseed was popular until people started slipping and it became a liability issue, and that balloons are out because their remains are not good for the environment. A letter to the editor responds that "experts in the field of butterflying consider this practice a form of environmental pollution, spreading diseases and parasites to wild butterfly populations." Robinson, George R., et al, "Diverse and Contrasting Effects of Habitat Fragmentation," Science 257(July 24, 1992):524-526. Different parts of an ecosystem respond in very different ways to habitat fragmentation. Soil mineralization and plant succession may be relatively uninterrupted. Some measures of plant and animal diversity may not change with differing sizes of fragmentation. But vertebrate population dynamics are greatly affected, as well as are plant species that reproduce by cloning. (v3,#3)

Robinson, J. B., et al. Life in 2030: Exploring a Sustainable Future in Canada. 1996. 224pp. \$19.95 paper. Rather than forecasting events, the authors backcast from what they would like to see happen in order to develop feasible, working alternatives for designing our future. Their prescriptions develop scenarios that allow for an appraisal of the changes required to achieve a sustainable society. (v8,#1)

Robinson, John and Herbert, Deborah, "Back From the Future," Alternatives 26 (No. 2, Sprg 2000): 32- . Future scenarios can help us foresee where climate change is leading and how we can choose a more sustainable path. (v.11,#2)

Robinson, John G., Redford, Kent H., and Bennett, Elizabeth L., "Wildlife Harvest in Logged Tropical Forests," Science 284(1999):595-596. Logging opens up roads and the trucks that travel them become conduits for a vast commercial trade in wild meat. Government is often unable to enforce regulations in remote areas; the social institutions with the most power are the logging companies themselves. Some, though not enough, prohibit their vehicles from carrying wild meat. Also, reforestation in tropical forests, where seeds are often large, depends on mammals. (v.12,#2)

Robinson, John G., "The Limits to Caring: Sustainable Living and the Loss of Biodiversity," Conservation Biology 7(1993):20-28. The IUCN/UNEP/WWF World Conservation Strategy, Caring for the Earth, is a purely utilitarian document, where the conservation and development of resources is the same process. This strategy will lead irrevocably to the loss of biological diversity. Sustainable use, while a powerful approach to conservation, is not sufficient, and, taken alone, results in environmental degradation. Biological conservation also requires a preservationist approach. Robinson is with the Wildlife Conservation Society, New York Zoo. (v4,#4)

Robinson, John, and Bennett, Elizabeth, eds., Hunting for Sustainability in Tropical Forests. New York: Columbia University Press, 1999. Tropical forests can sustain no more than one person per square

kilometer harvesting wildlife, if wildlife is to be conserved and sustainably harvested. Traditional peoples often existed in much lower numbers than that. When game was depleted traditional peoples could move on to other areas. Such patterns have now been broken, when these peoples turn to agriculture and still hunt in nearby forests, with guns, flashlights, radios, and motorized vehicles. Early success produces more children, and more hunters, who need food and want modern goods.

As food sources, rainforests are surprisingly low in productivity, compared to grasslands with their ungulates and other grazers. Grasslands produce ten times as much edible meat. Even relatively small harvests for forest wildlife can deplete the populations. Robinson is at the University of Florida. Bennett is with the Wildlife Conservation Society. (v10,#4)

Press of New England, 1994. 277pp. \$39.95 cloth. Using examples from the area of waste management but touching also upon issues such as the ozone layer, contaminated foodstuffs, and asbestos removal, Robinson presents a new vision for rational decision-making on environmental issues. He points out faults in our old policy-making methodology and offers a rationale for a decision procedure based less on certainty but more adapted and adaptive to our times. (v8,#2)

Robinson, William S., "Some Nonhuman Animals Can Have Pains in a Morally Relevant Sense," Biology and Philosophy 12(1997):51-71. In a series of works, Peter Carruthers has argued for the denial of the title proposition. Here I defend that proposition by offering direct support drawn from relevant sciences and by undercutting Carruthers' argument. In doing the latter, I distinguish an intrinsic theory of consciousness from Carruthers' relational theory of consciousness. This relational theory has two readings, one of which makes essential appeal to evolutionary theory. I argue that neither reading offers a successful view. Robinson is in philosophy at Iowa State University, Ames. (v8,#3)

Robison, Wade L. and Michael S. Pritchard. "Justice and the Treatment of Animals: A Critique of Rawls." Environmental Ethics 3(1981):55-61. Although the participants in the initial situation of justice in John Rawls' Theory of Justice choose principles of justice only, their choices have implications for other moral concerns. The only check on the self-interest of the participants is that there be unanimous acceptance of the principles. But, since animals are not participants it is possible that principles will be adopted which conflict with what Rawls calls "duties of compassion and humanity" toward animals. This is a consequence of the initial situation's assumption that principles of justice can be determined independently of other moral considerations. We question this assumption, and show that satisfactory modifications of Rawls' initial situation undermine its contractarian basis and require the rejection of exclusively self-interested participants. Robison and Pritchard are in the department of philosophy, Western Michigan University, Kalamazoo, MI. (EE)

Rocha, Jorge, Manipulação de vida. Para um futuro bioético (Manipulation of Life. For a bioethical Future), Faculdade de Letras da Universidade de Lisboa, 2000. M.A. thesis on the manipulation of life. The primary object of our reflection is the manipulation of living reality. By means of a philosophical inquiry about progresses in biotechnology, we analyze the conquests, the consequences, the promises and the risks of biotechnological investigation, but we also go further seeking for the epistemological and ethical foundations of the attitude to adopt about the manipulation of life in the present stage of knowledge. To accomplish this task it is important to realize who is making the decisions and to define who should make them and also what values must be considered. So our argument starts with the exhibition of the impossibility of knowing nature in an absolute and definitive way (especially living nature, because of its enormous complexity); then we go on defending that human action is based on human knowledge--always imperfect and temporary. After discussing the potential, the power, and the risks of increasing biotechnology, we conclude defending the urgency to submit biotechnological inquiry to the principle of precaution. (v.12,#4)

Roche, M, "Rural geography: searching rural geographies," Progress in Human Geography 26(no.6, 2002): 823-830.

Rocheleau, Jordy. "Democracy and Ecological Soundness," Ethics and the Environment 4(1999):39-56. Though the goals of democracy and ecological soundness are largely believed to be necessarily linked, there is sometimes a lack of adequate argument demonstrating this connection. Defining ecological soundness and democracy and showing weaknesses in some typical attempts to link them, I argue that

democracy is in fact necessary for ecological improvement. The undemocratic practices of capitalism, ecological discrimination, and global inequality all play key roles in environmental degradation. Drawing on David Schweickart's (1996) recent argument for "Economic Democracy" I defend such a model of democratic socialism as the most ecologically sound political and economic form currently possible. Rocheleau is in philosophy at Michigan State University, East Lansing. (E&E)

Rockefeller, Steven, Summary and Survey: Principles of Environmental Conservation and Sustainable Development. 146 pages. 1995 in working draft for the Earth Charter Project. Forty-seven major principles of conservation and sustainability that have been formulated to date in international law and related reports. Examples of such principles: the unity of the biosphere, elimination of unsustainable production, non-violent conflict resolution, and equitable use of transboundary natural resources. Röcklinsberg, Helena, "Consent and Consensus in Policies Related to Food - Five Core Values," Journal of Agricultural and Environmental Ethics 19(2006):285-299. When formulating a policy related to food in a heterogeneous context within a nation or between nations, oppositional positions are more or less explicit, but always have to be overcome. It is interesting to note, though, that such elements as culture and religion have seldom been the focus in discussions about methods of decision-making in food policy. To handle discrepancies between oppositional positions, one solution is to narrow differences between partners, another to accept one partner or position as dominant. In a solid and lasting policy, any of these options has to be agreed upon by all the partners involved. In this article, I argue that context sensitivity and a shared picture of the situation are necessary bases for a solid food policy. Two methods for policy discussion are elaborated on and religious slaughter is given as an example of a heterogeneous setting with strongly diverging ideals. Several aspects have to be respected from the outset, such as culture, religion, and value systems. This condition is partly met in a model of informed consent and in a consensus model. The informed consent model is regarded as insufficient, because it lacks both methods of dealing with hierarchies and the goal of finding a shared and nuanced picture of the situation. A consensus model meets these tasks but might on the other hand, among other things, be too difficult to follow and to administer. For both models, some difficulties with justification of decisions arise. Five essential elements emanating from a combination of these models are suggested as a basis for a decision process regarding food policies: respect for each discussion partner, context sensitivity, respect for arguments including emotions, a shared picture of the situation, and finally relating theory and practice. Keywords: consensus - context-dependent informed consent - decision-making - democracy - food policy - heterogeneous setting - religion. The author is in the Centre for Theology and Religious Studies, Lund University, Lund, Sweden. (JAEE)

Roebuck, Paul Kenneth, The Geography of Nature (Environmental Ethics, Indians, Water Rights), 1996, University of Minnesota, Ph.D. thesis in geography and philosophy. 279 pages. The Enlightenment tradition stresses scientism and instrumental reason. Reactions against this tradition--Expressivism, Romanticism and Indigenous Knowledge provide the underpinning for radical environmentalism. Insofar as naturalistic theories leave out meaning, they are implausible and distort human life and action. Enlightenment thought provided a theory of knowledge and humanity founded on atomism, mechanism, and materialism and a radically utilitarian ethics. This movement of ideas is usually treated as an epistemological revolution with anthropological consequences. Viewed differently, subjectivity underlies this revolution from the start. Western ideas of subjectivity, meaning, and identity shifted from the Medieval period through the Sturm und Drang and the Romantic period. Once we question essential notions about meaning and objectivity, social criticism can move beyond ethnocentric projection and offer a genuine critique of our practices. Native-American and European-American ideas of nature relating to water projects in the Southwest reveal this contrast. The advisor was Philip W. Porter. (v.10,#1)

Rogers-Hayden, Tee, and Campbell, John R., "Re-negotiating Science in Environmentalists' Submissions to New Zealand's Royal Commission on Genetic Modification," Environmental Values 12(2003): 515-534. The debate about genetic modification (GM) can be seen as characteristic of our time. Environmental groups, in challenging GM, are also challenging modernist faith in progress, and science and technology. In this paper we use the case of New Zealand's Royal Commission on Genetic Modification to explore the application of science discourses as used by environmental groups. We do this by situating the debate in the framework of modernity, discussing the use of science by environmental groups, and deconstructing the science discourses evident within environmental groups'

submissions to the Commission. We find science being called into question by the very movement that has relied on it to fight environmental issues for many years. The environmental groups are challenging the traditional boundaries of science, for although they use science they also present it as a culturally embedded activity with no greater epistemological authority than other knowledge systems. Their discourses, like that of the other main actors in the GM debate, are thus part of the constant re-negotiation of the cultural construct of 'science'.

Rogers, Raymond A. "Are Environmentalists Hysterical or Paranoid? Metaphors of Care and 'Environmental Security'?" Ethics and the Environment 5(2000):211-228. ABSTRACT: While there has been an increasing prevalence of security concerns with regard to the environment, there has also been a spate of books by moderate environmentalists engaged in "green-bashing" the more radical discussions of environmental issues (Rogers 1995). Both trends reflect the intensification of the forces of economic globalization that are rendering the world into categories that suit those expanding realities and undermine significant analysis of the relationship between those expanding realities and current environmental problems.

The apparent denigration in the title of this article is meant to draw attention to the relationship between representations of environmental issues and economic realities, especially in the context of disagreement, where contested realities are discussed in dramatically different ways by various interests concerned with environmental issues. What is clear in the context of these disagreements is that "ownership" of the issue has significant ramifications for not only understanding the causes of problems, but also for what to do about them.

A starting point for this analysis is the increasingly common appearance of the word "security" in the titles of articles and books dealing with environmental issues. Concerns are expressed with regard to "food security," "security of resources," and the more generic "environmental security," among many. Indeed, the U.S. Central Intelligence Agency now has an environmental department. What interests me, then, is the significance for human communities and natural communities of the increasing appearance of the word "security"-as represented in the work of such analysts as Thomas Homer Dixon--and the way the concern for security tend to minimize any land dispossession. (E&E)

Rogers, Will, "It's Easy Being Green," New York Times, November 20, 2004, p. A31. The real surprise in the recent U.S. election was the environment. Across the country, in red states and blue states, Americans voted decisively to spend more money for natural areas, neighborhood parks, and conservation in their communities. Of 161 conservation ballot measures, 120, or 75 percent, were approved by voters. The cost of measures approved is 3 1/2 billion dollars. (v.14, #4)

(in Croatian) Modernity is not characterized by emphasis on expanding rationality, but rather by a defining of the immediate life, but both these opposite and complementary models characterize the postmodern period, a double-coding which is the basis of environmental critique. The author is in architecture, at the University of Zagreb. (v7,#1)

Rogn, Ketil, From Earth Ethics to Political Ecology: Theory and Practice in Environmental Philosophy. M.A. thesis, Colorado State University, spring 2002. In both environmental ethics and discourse ethics theory precedes and governs practice. Environmental ethics operates from theory that creates substantive recommendations for practice. The discourse ethicist argues that such recommendations can only be created in communication among those involved, but this communication is subject to certain formal demands. This thesis proposes an alternative model in which political and ethical organization precedes and gives rise to political and ethical principles. Adapting ideas from Spinoza about the concrete reality of the body, there arise assemblages of organizations concerned about environmental issues, engaged in political advocacy and advocating an ethic. We generate and revise principles in result and accordingly. Rogn is from Norway. (v.13,#1)

Rohde, Rick, "Ideology, Bureaucracy and Aesthetics: Landscape Change and Land Reform in Northwest Scotland," Environmental Values 13(2004):199-221. Scottish devolution and land reform were high on the political agenda with Labour's victory at the general election in 1997. In the Highlands of Scotland, where disputes over the ownership and control of land have a long history, initiatives involving the community ownership of land were gathering pace, one of which was Orbost Estate in Skye. What began as an 'experiment' in building a new community with the intention of creating a model for land reform, by 2002 had become a symbol of community opposition and heavy-handed mismanagement by bureaucrats. The conflict between local objectors and the government-funded enterprise company that bought the estate, was fought on ideological, aesthetic and bureaucratic grounds. The discourse of conflict reflected opposing understandings of the social, historical and cultural environment - values that are associated with and 'naturalised' in the landscape. Rural development is increasingly subject to rigid planning guidelines based on notions of visual landscape aesthetics and imputed historical-cultural values associated with the area's tourist industry. In the absence of strong local democratic institutions, objectors and developers arrived at an uneasy compromise after several years of dispute, through the agency of the bureaucratic planning apparatus itself. This study illustrates how the multi-faceted concept of landscape mediates cultural, social and political issues, and is continually evolving in response to aesthetic, ideological and institutional agencies. Rohde lives in Edinburgh. (EV)

Roht-Arriaza, Naomi, "Environmental Management Systems and Environmental Protection: Can ISO 14001 Be Useful Within the Context of APEC?" The Journal of Environment and Development 6 (no. 3, 1997):292. ISO 14001 is a set of environmental protection standards agreed upon by the 18 member

nations of the Asian Pacific Economic Cooperation forum, involving voluntary action by industries to better their environmental performance. The general conclusion is that this is useful but not nearly enough. (v8,#3)

Rohter, Larry, "Mapuche Indians in Chile Struggle to Take Back Forests," New York Times, August 11, 2004, A3. Mapuche Indians in Chile claim that false land titles and damage to the environment are undermining their traditional way of life and are struggling to take back land they claim is theirs. Much of their traditional forest is now tree farms for export timber. The current dispute continues a conflict that has existed since the arrival of the conquistadors. Chile's nominally Socialist government seeks to blunt the indigenous movement by invoking a modified version of an anti-terrorist law. Mapuches have burned forests or farmhouses or destroyed forestry equipment and trucks. But they claim they are not terrorists because they have harmed no people. (v. 15, # 3)

Rohter, Larry, "Record Drought Cripples Life Along the Amazon," New York Times, Dec. 11, 2005. The Amazon basin has the most devastating drought in a century of record-keeping. Hundreds of riverside settlements are cut off from the outside world. Scientists say the drought is most likely a result of the same rise in water temperatures in the tropical Atlantic Ocean that unleashed Hurricane Katrina. The warmer air over the ocean goes up, which triggers descending (and warming) air over the Western Amazon, dispersing clouds that would otherwise have given rain.

Rojas, Martha, "The Species Problem and Conservation: What Are We Protecting?" Conservation Biology 6(1992):170-178. "There is no agreement on what species are, how they should be delimited, or what they represent. But in conservation science ... species are either treated as types or as evolutionary units." Rojas finds difficulties, both theoretical and practical, with either approach, which result in insufficient protection of biodiversity. Much of the variation that it is desirable to protect may not be registered at the level of species. Rojas is with the Funcación Natura, Bogata, Columbia. (v3,#4)

Rojstaczer, Stuart, Sterling, Shannon M., and Moore, Nathan J., "Human Appropriation of Photosynthesis Products," Science 294(21 December 2001):2549-2552. A study by Vitousek et al 15 years ago, based largely on extrapolations from limited field based studies, estimated that humans co-opt about 42% of the global terrestrial production. This new study now provides an update based on recent, mainly satellite-based surveys and an error analysis. These authors reach a similar conclusion through this different methodology, but caution that the uncertainties are still very large for several key parameters, namely the productivity of agricultural and the biomass of secondary forests. Rollin, Bernard E., "Farm Factories: The End of Animal Husbandry," Christian Century 118 (no. 35, Dec. 19-26, 2001):26-29. Industrial animal agriculture is a major departure from traditional agriculture and its core values. Our ancient contract with domestic animals is not on the minds of today's farmers. Yet despite the real problems in these farm factories, few Jewish and Christian leaders, theologians or ethicists have come forward to raise moral questions. If we take biblical ethics seriously, we must condemn any type of agriculture that violates principles of husbandry. It is a radical mistake to treat animals merely as products, as objects with no intrinsic value. A demand for agriculture that practices the ancient and fair contract with domestic animals is not revolutionary but conservative. Rollin is in philosophy at Colorado State University. (v.13,#1)

Rollin, Bernard E., "Animal Welfare, Science, and Value", Journal of Agricultural and Environmental Ethics 6(1993), Supplement. A main component of 20th century scientific ideology is the view that science is "value-free." This notion has dominated the view of animal welfare in the emerging field of animal welfare science. Science however, is neither value-free in general, nor ethics-free in particular. The value-laden nature of the concept of "animal welfare" is clear, and even what information is considered to count as facts is structured by valuational presuppositions. Animal pain and stress, which were, until recently, viewed strictly in physicalistic terms, have become increasingly viewed in terms of animal subjective experience, as society grows more and more concerned about animal suffering. The new ethic emerging for animals in society is thus calling for a concept of welfare significantly different from traditional views such as the one which equates welfare with productivity. Rollin is in the Department of Philosophy, Colorado State University, Fort Collins, CO.

Rollin, Bernard, "Send in the Clones...Don't Bother, They're Here," Journal of Agricultural and Environmental Ethics 10(1997):25-40. The creation of a cloned sheep from mammary tissue has raised major social concern and much talk about major ethical issues, occasioned by this technology. It is necessary to separate genuine from spurious ethical issues here, a task made more difficult than need be by the research community's failure to initiate ethical discussion and explanation of new technology as well as by fear reactions in society. As in genetic engineering of animals, issues about cloning fall into three categories--suggestions that the technology is inherently wrong, risk emerging from the technology and harm to the creature engendered. The issues regarding the cloning of humans can be analyzed using the same categories. (JAEE)

Rollin, Bernard. "Ethics, Science, and Antimicrobial Resistance." Journal of Agricultural and Environmental Ethics 14(2001):29-37. The issue of regularly feeding low levels of antibiotics to farm animals in order to increase productivity is often portrayed as a dilemma. On the one hand, such antibiotic use is depicted as a necessary condition for producing cheap and plentiful food, such that were such use to stop, food prices would rise significantly and our ability to feed people in developing nations would decrease. On the other hand, such antibiotic use seems to breed antibiotic resistance into pathogens affecting human health. Resolving this dilemma, it is alleged, will require great amounts of research into risk/benefit assessment. Contrary to this claim, we will argue that society has all the data it needs to make a reasonable ethical decision, which would be curtailing such use. Such curtailment will not harm consumers significantly, will not harm developing nations' evolving agriculture, and could produce

hitherto unnoticed benefits, namely restoring the possibility of a more husbandry-based, sustainable agriculture to replace the high-tech agriculture that has hurt animals, the environment, small farms, and sustainability. Keywords: antibiotics, antibiotic resistance, antimicrobial resistance, feeding of antibiotics to food animals, sustainability, farm animal welfare, husbandry. Rollin is in philosophy, Colorado State University, Fort Collins, Colorado. (JAEE)

Rolston, Holmes, III, "The land ethic at the turn of the millennium," Biology and Conservation 9(2000):1045-1058. Abstract. Aldo Leopold's land ethic has proved more complex and subtle than he envisioned. Nevertheless, Leopold launched what, facing a new millennium, has proved urgent on the global agenda: an environmental ethics concerned is theory and practice about appropriate respect for values carried by the natural world and human responsibilities for the sustaining of these values. A blending of anthropocentric and biocentric values continues to be vital. These duties toward nature, involve analysis of ecosystem integrity and evolutionary dynamism at both scientific and philosophical levels; any responsible environmental policy must be based on plausible accounts of ecosystems and a sustainable biosphere. Humans and this planet have entwined destinies. We now envision an Earth ethic beyond the land ethic. Key words: Aldo Leopold, Earth ethics, environmental ethics, land ethic, naturalized ethics. Rolston is in philosophy, Colorado State University. (v.13,#1)

The Congress was held November 5-9 2000 in Campo Grande, Brazil, and this is a plenary address, in English. Although much of the urgency for conserving biodiversity arises from our duties to other humans, with nature instrumental to what humans have at stake in their environments, a deeper environmental ethics recognizes intrinsic values in and duties directly to nature. Such duties arise because values are present at the levels of animals, living organisms, endangered species, and ecosystems as biotic communities. Ultimately and increasingly, we are responsible for and to Earth as planet and biosphere. Only people can be ethical, but this does not mean that only people count in ethics; to the contrary we are fully human only when we appropriately respect life on Earth in all its rich biodiversity. Rolston, Holmes, III. "From Beauty to Duty: Aesthetics of Nature and Environmental Ethics." Pages 127-141 in Berleant, Arnold, ed., Environment and the Arts: Perspectives on Environmental Ethics.

Aldershot, Hants., UK: Ashgate Publishing Co., 2002. In both environmental aesthetics and environmental ethics something of value is at stake. These are often connected: If beauty, then: duty. But not all duties are tied to beauties. Other premises, such as resource use or respect for life, might better yield duties, features often thought less subjective and more objectively present. Human aesthetic capacities depend, however, on aesthetic properties of value. Wildlife admirers focus on animal excellences, the conflict and resolution in wild lives. Biotic communities, ecosystems, have their integrities. In a participatory aesthetics, our sense of identity enlarges; an appropriate admiration for nature transforms into our caring.

Rolston, Holmes, III, "Respect for Life: Christians, Creation, and Environmental Ethics," CTNS Bulletin (Center for Theology and the Natural Sciences, Graduate Theological Union, Berkeley), vol. 11, no. 2 (Spring 1991):1-8. An autobiographical account of a would-be philosopher and theologian gone wild, rediscovering a creation lost to both philosophy and theology. "There is something unChristian, something ungodly about living in a society where one species takes itself as absolute and values everything else relative to its national or personal utility." (v2,#2)

Rolston, Holmes, III. Review of South African Environments into the 21st Century. By Brian Huntley, Roy Siegfried, and Clem Sunter. Environmental Ethics 14(1992):87-91.

Rolston, Holmes, III, "Values Deep in the Woods." American Forests 94, nos. 5 & 6 (May/June 1988): 33, 66-69. The title is a typical Rolston device, a play on the word "deep." This short piece argues that the forest has a deep, objective, or intrinsic value as a source of the natural creative process that is far more important than the instrumental and commodity values produced as a managed resource. Rolston, Holmes, III, "Aesthetic Experience in Forests," The Journal of Aesthetics and Art Criticism 56 (no. 2, Spring 1998):157-166. Forests are aesthetically challenging because of the sense of deep time confronted there, experiencing forests as an archetype of creation. Forests are both perennial and dynamic. Appropriate aesthetic encounter in forests requires knowledge of natural history, scientific appreciation, necessary though not sufficient for an intense, multisensory, participatory engagement when persons, immersed in forests, constitute their lived aesthetic experiences. Forests, although naturalized, are experienced as sublime, evoking also the sense of the sacred. At every level, aesthetic appreciation in forests radically differs from that appropriate for artworks. Rolston teaches philosophy at Colorado State University.

Rolston, Holmes, III, "Aesthetics in the Swamps," Perspectives in Biology and Medicine 43 (no. 4, 2000):584-597. Wetlands are the most misunderstood of landscapes, typically experienced negatively as swamps, sloughs, and mires, and this includes their aesthetic appreciation. A scientific understanding of wetlands radically revises this estimate. Understanding wetlands ecology, knowledge of the specialized

flora growing there and their unusual adaptations, and awareness of wetlands diversity can enrich aesthetic appreciation of these typically unappreciated landscapes. This revises both our estimate of "swamps" and also our aesthetic norms. Aesthetic experiences include a sense of the primeval, admiration for ingenious and odd solutions to the challenges of wetlands living, appreciation of individually inconspicuous plants en masse in their cumulative sweep and flair, of waterfowl and other fauna, of spontaneous order in ecosystems, and of life persisting in the midst of its perpetual perishing. Keywords: aesthetics, beauty, swamps, mires, bogs, adaptive fitness, spontaneous order, primeval nature, persistence of life. (v.11,#4)

Rolston, Holmes, III, Philosophy Gone Wild: Essays in Environmental Ethics. Buffalo: Prometheus, 1986. Pp. 269. This is an extensive (but by no means comprehensive) collection of essays by one of the field's leading thinkers. Rolston has long grappled with the problem of articulating and justifying values in nature itself. His groundbreaking essay, "Is There an Ecological Ethic?" reprinted here, was the first to call for a revolutionary ethic, an ethic informed by and based on ecological principles. This collection serves the important purpose of bringing together fifteen of Rolston's essays. Several chapters begin on the level of personal experience and reflection regarding nature and wilderness. The essays date from 1968-1985; those from 1983 on are listed separately in this bibliography where they originally appeared. (Katz, Bibl # 1)

Rolston, Holmes, III. "Can and Ought We to Follow Nature?" Environmental Ethics 1(1979):7-30. "Nature knows best" is reconsidered from an ecological perspective which suggests that we ought to follow nature. The phrase "follow nature" has many meanings. In an absolute law-of-nature sense, persons invariably and necessarily act in accordance with natural laws, and thus cannot but follow nature. In an artifactual sense, all deliberate human conduct is viewed as unnatural, and thus it is impossible to follow nature. As a result, the answer to the question, whether we can and ought to follow nature, must be sought in a relative sense according to which human conduct is sometimes more and sometimes less natural. Four specific relative senses are examined: a homeostatic sense, an imitative ethical sense, an axiological sense, and a tutorial sense. Nature can be followed in a homeostatic sense in which human conduct utilizes natural laws for our well-being in a stable environment, but this following is nonmoral since the moral elements can be separated from it. Nature cannot be followed in an imitative ethical sense because nature itself is either amoral or, by some accounts, immoral. Guidance for inter-human ethical conduct, therefore, must be sought not in nature, but in human culture. Nevertheless, in an axiological

sense, persons can and ought to follow nature by viewing it as an object of orienting interest and value. In this connection, three environments are distinguished for human well-being in which we can and ought to participate--the urban, the rural, and the wild. Finally, in a tutorial sense, persons can and ought to follow nature by letting it teach us something of our human role, our place, and our appropriate character in the natural system as a whole. In this last sense, "following nature" is commended to anyone who seeks in his or her human conduct to maintain a good fit with the natural environment--a sense of following nature involving both efficiency and wisdom. Rolston is in the department of Philosophy, Colorado State University, Fort Collins, CO. (EE) Also published in Philosophy Gone Wild. Rolston, Holmes, III, "Biology and Philosophy in Yellowstone," Biology and Philosophy 5 (no. 2, 1990):241-258. Philosophical issues in Yellowstone biology and policy, responding to the criticism of Alston Chase, Playing God in Yellowstone. Chase, formerly a professor of philosopher at Macalaster College, has been an acid critic of park policy and the naturalistic philosophy of "letting nature take its course" on which it is based. Chase favors a policy based on "sound, scientific management." A shortened version is "Yellowstone: We Must Allow It To Change," High Country News 23 (no. 10, June 3, 1991):12-13. (v1,#2)

A clear expression of Rolston's environmental philosophy of value, history, and place, set against a discussion of park management policy in Yellowstone National Park and a criticism of the work of Alston Chase. There is a spectrum of naturalness that should be respected; there is a size and scale which defies intervention; there is a dynamic natural history that ought to be appreciated and loved. Rolston, Holmes, III, "Nature, the Genesis of Value, and Human Understanding," Environmental Values 6(1997):361-364. Reply to Thomas, Emyr Vaughan, "Rolston, Naturogenic Value and Genuine Biocentrism," Environmental Values 6(1997):355-360. Many anthropogenic values are indeed important, but I deny that nature is otherwise value free, and recommend to humans a psychological joining (with) ongoing natural history, since there is value wherever there is positive creativity. Epistemologically, it is impossible for any knower not to be participant in what he or she knows. We will have to use our eyes, ears, noses, hands, minds. What we know will be filtered through our percepts and concepts. But that does not make the discovery of valued features in nature assimilationist or anthropocentric. I defend a rather more critical realism. (EV)

With published commentary, Ned Hettinger, "Comments on Holmes Rolston's 'Naturalizing Values'," pages 86-89.

Philosophers are naturalizing ethics, epistemology, and metaphysics, but seem unable and unwilling to naturalize value. But values are deeply embedded in evolutionary and ecological natural history. Biologists are regularly discovering such values; survival value is a key to natural selection and adapted fit. Nevertheless, most philosophers insist that value is anthropocentric, allowing only dispositional value to nature, also value where there is sentient life. These psychological accounts are

incomplete. This is evidenced in non-sentient organisms, in species lines, and in genetic knowledge. Unless we naturalize values, we face an epistemic and axiological crisis. (v.11,#1)

Rolston, Holmes, III. "Values in Nature." Environmental Ethics 3(1981):113-28. Nature is examined as a carrier of values. Despite problems of subjectivity and objectivity in value assignments, values are actualized in human relationships with nature, sometimes by (human) constructive activity depending on a natural support, sometimes by a sensitive, if an interpretive, appreciation of the characteristics of natural objects. Ten areas of values associated with nature are recognized: (1) economic value, (2) life support value, (3) recreational value, (4) scientific value, (5) aesthetic value, (6) life value, (7) diversity and unity values, (8) stability and spontaneity values, (9) dialectical value, and (10) sacramental value. Each is analyzed and illustrated with particular reference to the objective precursors of value as these are described by natural science. Rolston is in the department of Philosophy, Colorado State University, Fort Collins, CO. (EE) Also published in Philosophy Gone Wild. In the light of evolutionary biology, the biblical idea that nature fell with the coming of human sin is incredible. Biblical writers, classical theologians, and contemporary biologists are ambivalent about nature, finding in natural history both a remarkable genesis of life and also much travail and suffering. Earth is a land of promise, and there is the conservation, or redemption, of life in the midst of its perpetual perishing. Life is perennially a struggling through to something higher. In that sense even natural history is cruciform, though human sinfulness introduces novel tragedy. Humans now threaten creation; nature is at more peril than ever before. Keywords: conservation of nature; creation; ecological crisis; evolution; natural evils; nature; redemption; sin; suffering, wildness. (v5,#2)

Rolston, Holmes, III. "Are Values in Nature Subjective or Objective?" Environmental Ethics 4(1982):125-51. Prevailing accounts of natural values as the subjective response of the human mind are reviewed and contested. Discoveries in the physical sciences tempt us to strip the reality away from many native-range qualities, including values, but discoveries in the biological sciences counterbalance this by finding sophisticated structures and selective processes in earthen nature. On the one hand, all human knowing and valuing contain subjective components, being theory-laden. On the other hand, in ordinary natural affairs, in scientific knowing, and in valuing, we achieve some objective knowing of the world, agreeably with and mediated by the subjective coefficient. An ecological model of valuing is proposed, which is set in an evolutionary context. Natural value in its relation to consciousness is examined as an epiphenomenon, an echo, an emergent, an entrance, and an education, with emphasis on the latter categories. An account of intrinsic and instrumental natural value is related both to natural objects, life forms and land forms, and to experiencing subjects, extending the ecological model. Ethical imperatives follow from this redescription of natural value and the valuing process. Rolston is in the department of philosophy, Colorado State University, Fort Collins, CO. (EE)

Rolston, Holmes, III, "Natural and Unnatural; Wild and Cultural," Western North American Naturalist 61(no. 3, 2001):267-276. In a theme issue on exotic species in Yellowstone National Park. Originally the Aubrey L. Haines Distinguished Lecture at the Fifth Biennial Scientific Conference on the Great Yellowstone Ecosystem, National Park Service, Yellowstone National Park, WY, October 11-13, 1999.

Yellowstone National Park's mission and policy can be clarified by analysis of the "natural" and the "unnatural." "Nature" is a comprehensive word, on some uses excluding nothing; more useful is a contrast distinguishing "nature" and "culture." Specifying "wild nature" denotes spontaneous nature absent human influence. Critics claim that the meaning of "wild nature," especially of "wilderness" is a foil of "culture." Pristine nature, often romanticized, is contrasted with a technological and industrial culture. By this account, "wilderness" is a social construction.

Nevertheless "wild nature" successfully denotes, outside culture, an evolutionary and ecological natural history, which remains present on the Yellowstone landscape, jeopardized by numerous human influences, including the invasions of exotic species. Natural processes have returned in the past, as when native Americans left the landscape. Natural processes can be preserved today, because of, rather than in spite of, park management. Over much of the North American landscape nature is managed and at an end. Yellowstone provides an opportunity to encounter and to conserve "untrammelled" nature as an end in itself, past, present, and future. Key words: nature, natural, wild, pristine, wilderness, culture, management, exotics. Rolston is in philosophy at Colorado State University. (v.12,#3)

Rolston, Holmes, III, Environmental Ethics: Duties to and Values in the Natural World. Philadelphia: Temple University Press, 1987. Pp. xiii, 416. This is a culmination of a twenty year investigation into the nature of environmental value and ecological ethics by the foremost scholar in the field. Although much of this book has appeared before in different forms, Rolston's position and argument gain immeasurably from a book length presentation. Here for the first time is Rolston's complete view of environmental ethics: his theory of objective natural value, his view of humanity's place in the environment, his analysis of the value of (and thus duties to) animals, organisms, species, ecosystems, and his practical policy recommendations for environmental managers and businessmen. Rolston presents a philosophy of nature, but this is no traditional metaphysic; it is a philosophy of nature imbued with ecological science and value. Its goal is to provide mankind with an ethic that is a residence, a "significant place to dwell" (p. xii). Perhaps the most important theoretical point is Rolston's establishment or discovery of a third kind of value in ecological systems: in addition to intrinsic and instrumental values there is systemic value. "Systemic value is the productive process; its products are intrinsic values woven into instrumental relationships" (p. 188). Of great importance is his defense of objective, intrinsic value in natural entities--value that transcends a valuing consciousness. "Values are objectively there--discovered, not generated, by the valuer" (p. 116). One of the strengths of this book is that Rolston is reluctant to close the door on any kind of natural value. He presents his case in steps, starting with anthropocentric instrumental values of nature, moving to the intrinsic value of sentient life experiences in the animal kingdom, to the intrinsic good-of-its-kind of natural organisms, on to the environmental fitness of species in ecosystems. The argument is supported by many real life examples. Rolston also tackles some persistent problems in environmental ethics; e.g., individual rights in a holistic value system, the superiority of human life, and the clash between a culture-based and a natural ethic. My one criticism is that some chapters seem "patched" together from the earlier versions of these arguments in other articles. But this is a minor problem when one views the overall organization of the book. Like the ecosystem itself, this book as a whole has more value than its individual parts. (Katz, Bibl # 1) Reviewed in Environmental Ethics 8(1986):163-77.

Rolston, Holmes, III, "Nature for Real: Is Nature a Social Construct? Pages 38-64 in Chappell, T. D. J., ed., The Philosophy of the Environment. Edinburgh: Edinburgh University Press, 1997, and New York: Columbia University Press, 1997. The claim that "nature" is a social construct has become commonplace, confusedly mixing cultural ideas of "nature" with nature in itself. Humans have no unmediated access to nature; we do not and cannot know nature for real--so it is claimed. "The world" is variously "constituted" by diverse cultures; and there is doubt about what, if anything, is "privileged" about the prevailing Western concepts. All such word-ideas, world-ideas, have been made up historically by peoples in their multifarious cultures. "Nature," "environment," "wilderness," "science" in its descriptions of "nature," and "Earth" as planet and world viewed--all now have a modernist color to them, and the make-up of the words colors up what we see.

More radically, all human knowing colors whatever people see, through our percepts and concepts. The skepticism runs deep. Many question whether humans know nature at all, in any ultimate or objective sense. The pejorative word is "absolute," comparably to "privileged" as revealing our bias in "right" or "true". Rather we know nature only provisionally or operationally; "pragmatically" is the favored word). There is an epistemic crisis in our philosophical culture, which, on some readings, can seem to have reached consummate sophistication, and, the next moment, can reveal debilitating failure of nerve.

Philosophers need to ask, in theory, whether nature is for real, to know, in practice, whether and how ethicists ought to conserve it. The less we really know about nature, the less we can or ought save nature for what it is in itself, intrinsically. We cannot correctly value what we do not to some degree correctly know. The epistemic crisis is as troubling as the environmental crisis, and one must be fixed before the other can. Rolston teaches philosophy at Colorado State University. (v.8,#4)

Rolston, Holmes, III, "Environmental Ethics: Some Challenges for Christians," The Annual, Society of Christian Ethics, 1993, pages 163-186. Boston: The Society of Christian Ethics, 1993; distributed by Georgetown University Press. Christianity is a religion for people, relating persons to persons, yet it also has an environmental ethics. But the Christian ethics for persons, calling for love, justice, benevolence, and compassion does not transfer easily to duties toward wildlife, who may not be appropriate subjects for compassion, benevolence, or justice, and the difficulties compound with an ethic toward plants, species, and ecosystems. The Biblical faith began with a land ethic, a covenanted promised land, and Christians find a nature that is sacred and good in itself, regardless of its human utility. Earth is a planet with promise, the nature found on Earth is graced with creativity, if also with persisting in the midst of its perpetual perishing. Nature is also cruciform, the beauty approaches the sublime, death is perpetually redeemed with the renewal of life, and in that sense the central themes of Christianity are congenial to an environmental ethic. Rolston is professor of philosophy at Colorado State University. (v4,#4)

Rolston, Holmes, III, Conserving Natural Value. New York: Columbia University Press, 1994. 259 pages. Paper, \$ 19.50. Cloth \$ 49.50. Chapter titles and sections: Chapter 1. Natural and Cultural Values: Nature and Culture; Entwined Destinies, Nature Supporting Culture; Residence and Resource, Commodity and Community; Urban, Rural, and Wild; Environmental Values and Human Rights; Future Generations; Environmental Policy; Balancing Natural and Cultural Values. Chapter 2. Diversity and Complexity Values: Diversity; Complexity; The Evolution of Diversity and Complexity; Rarity; Biodiversity and the Commons; Richness; Balancing Biodiversity Values and Cultural Values. Chapter 3. Ecosystem Integrity and Health Values: Ecosystem Integrity and Health; Stability and Historical Change; Community; Sustainability; Restoration; Balancing Integrity and Health Values. Chapter 4. Wildlife Values: Lower and Higher Animals; Animal Rights?; Animal Welfare and Managed Wildlife; Feral and Exotic "Wildlife"; Aesthetic Appreciation of Wildlife; Using Wildlife: Animal Sports; Using Wildlife: Animal Commerce; Wildlife in Culture. Chapter 5. Anthropocentric Values: Human Values Carried by Nature; Winning or Losing in Environmental Ethics?; Rich and Poor, Population and Consumption; Human Rights to Development; Democracy, Economics, and Environment; Anthropocentric and Anthropogenic Values; Human Excellences and Natural Values; Chapter 6. Intrinsic Natural Values: Life as Conservation; Intrinsic, Instrumental, Systemic Values; Storied Achievement; Integrity of Place; Wilderness; Objective and Subjective Natural Value; The End of Nature? Chapter 7. The Home Planet: Land Ethics and Earth Ethics: National Resources and Common Natural Heritage; International Law and Environmental Ethics; Mother Earth?; Managing the Planet?; Balancing Global Natural and Human Cultural Values; Inheriting the Earth. The book is written for freshmen and sophomore level, for use in classes alike in biological and natural resource conservation and

in environmental philosophy, ethics, and policy. Rolston is professor of philosophy at Colorado State University.

Rolston, Holmes, III and James E. Coufal, "A Forest Ethic and Multivalue Forest Management," Journal of Forestry, April 1991. The Society of American Foresters currently has under active consideration adopting a professional statement including a land ethic, and the April issue of the Journal of Forestry addresses that issue. Rolston and Coufal call for a shift from a multiple use ethic to an ethic of multiple values, a shift to deepen a commodity orientation to a community orientation, and a joining of human and biotic values, recognizing that "the forest itself is value-laden." "A forest ethic will require an unprecedented use of science and conscience, applied science and applied ethics." "Deeper appreciation of forests could be forestry's greatest benefit to society." "The integrity of foresters and the integrity of forests are bound together." Rolston is professor of philosophy at Colorado State University. Coufal is professor of forestry, College of Environmental Science and Forestry, State University of New York, Syracuse. (v2,#1)

Rolston, Holmes, III. "Valuing Wildlands." Environmental Ethics 7(1985):23-48. Valuing wildlands is complex. (1) In a philosophically oriented analysis, I distinguish seven meaning levels of value, individual preference, market price, individual good, social preference, social good, organismic, and ecosystemic, and itemize twelve types of value carried by wildlands, economic, life support, recreational, scientific, genetic diversity, aesthetic, cultural symbolization, historical, character building, therapeutic, religious, and intrinsic. (2) I criticize contingent valuation efforts to price these values. (3) I then propose an axiological model, which interrelates the multiple levels and types of value, and some principles for wildland management policy. Rolston is in the department of philosophy, Colorado State University, Fort Collins, CO. (EE) Also published in Philosophy Gone Wild.

Rolston, Holmes, III, "Feeding People versus Saving Nature?" Pages 248-67 in William Aiken and Hugh LaFollette, World Hunger and Morality. 2nd ed. Upper Saddle River, NJ: Prentice-Hall, 1996. One ought to feed people rather than save nature? Hungry loggers eat spotted owls! But the seemingly simple question is configured in a complex gestalt. People widely value many worthwhile things over feeding the hungry; they post national boundaries across which the poor may not pass; there is unjust distribution of wealth; escalating birthrates offset any gains in alleviating poverty; there is low productivity on already domesticated lands; sacrificed wildlands are often low in productivity; and significant natural values may be at stake. In some circumstances, one ought to save nature rather than feed people. Rolston teaches philosophy at Colorado State University. (v6,#4)

Rolston Holmes, III, "Biology Without Conservation: An Environmental Misfit and Contradiction in Terms." In Conservation for the Twenty-first Century, eds. David Western and Mary C. Pearl (New York: Oxford University Press, 1989), pp. 232-240. Discussion of the scientific, cultural, and moral meanings

of conservation. "Conservation in physics pervades the universe as a natural law. Conservation in biology has to defend a local, earth-bound self-organization" (p. 234). The unique character of biological conservation leads to a moral role for humans as the conservors of natural history. (Katz, Bibl # 2)

Rolston, Holmes, III, "Can the East Help the West to Value Nature?" Philosophy East and West 37, no. 2 (April 1987):172-190). Surveys some mainstream Eastern religious ideas to see if they can help the West in a re-orientation of values regarding nature; his answer is that the East will not help in the specific area of concrete action.

Rolston, Holmes, III, "Beyond Recreational Value: The Greater Outdoors," in Laura B. Szwak, ed., Americans Outdoors: A Literature Review (Washington: Government Printing Office, 1987) Paper commissioned by President's Commission on Americans Outdoors.

Rolston, Holmes, III, "Environmental Protection and an Equitable International Order: Ethics after the Earth Summit," Business Ethics Quarterly 5(1995):735-752. The UNCED Summit established two new principles of international justice: an equitable international order and protection of the environment. Wealth is asymmetrically distributed; approximately one-fifth of the world produces and consumes approximately four-fifths of goods and services. This difference can be interpreted as both an earnings differential and as exploitation; responses may require justice or charity, producing and sharing.

Rolston, Holmes, III, "Saving Nature, Feeding People, and the Foundations of Ethics," Environmental Values 7(1998): 349-357. I reply to Robin Attfield's and Andrew Brennan's criticisms of my claim that, at difficult times, one ought to conserve nature preferentially to caring for persons who are poor. They argue that such tradeoffs are avoidable, also that I fail to lay blame and responsibility for such lamentable circumstances in the right places. I argue that tiger conservation in Royal Chitwan National Park, Nepal, does and ought to give tiger conservation priority over some of the desires for development of locally impoverished peoples. Ben Minter argues that nature conservation ought to be "culturally-occupied"; I argue respect for intrinsic value in nature. KEYWORDS: poverty, democracy, environmental justice, Royal Chitwan National Park, Nepal, tigers. Holmes Rolston, III is at Colorado State University. (EV) Download/print in PDF format, 500 kb.:

Rolston, Holmes, III, "Rights and Responsibilities on the Home Planet," Yale Journal of International Law 18 (no. 1, 1993):251-279. From a Symposium on Human Rights and the Environment, Yale Law School and the American Association for the Advancement of Science, April 1992. Short version

reprinted in Zygon: Journal of Religion and Science 28(1993):425-439. Earth is the home planet, right for life. But rights, a notable political category, is, unfortunately, a biologically awkward word. Humans, nonetheless, have rights to a natural environment with integrity. Humans have responsibilities to respect values in fauna and flora. Appropriate survival units include species populations and ecosystems. Increasingly the ultimate survival unit is global; and humans have a responsibility to the planet Earth. Human political systems are not well suited to protect life at global ranges. National boundaries ignore important ecological processes; national policies do not favor an equitable distribution of sustainable resources. But there are signs of hope. Rolston is professor of philosophy at Colorado State University. (v4,#4)

Rolston, Holmes, III, "In Situ and Ex Situ Conservation: Philosophical and Ethical Concerns." Pages 21-39 in Guarrant, Jr., Edward O., Kayri Havens, and Mike Maunder, eds., Ex Situ Plant Conservation: Supporting Species Survival in the Wild. Washington, DC: Island Press, 2004. Understandings of "natural" and "artificial" lie in the background of discussions about in-situ and ex-situ conservation. Plants growing ex-situ in botanic gardens are hybrids of the natural and the artificial. There will be temptations to substitute ex-situ for in situ conservation, believing this to protect the desired resource base. More radical ethical issues arise regarding intrinsic values in plants. A plant is a living organism with a good of its own, autonomous intrinsic value. In their defense of their lives and species lines, plants are evaluative organisms independently of humans. The intrinsic values in plants are ecosystemically situated. In this sense intrinsic plant value is in-situ. Removed to an ex-situ location, a plant--especially a domesticated or captive plant--becomes something else, compromised in its integrity. Such compromise may be pragmatically and politically necessary, but it needs to be recognized philosophically and ethically as prejudicing the values carried by plants. Unless done with great care and clarity of purpose, ex-situ conservation will undercut in-situ conservation, with a resulting sacrifice of value. Originally a paper for the Chicago Botanic Garden. Rolston is in philosophy at Colorado State University.

Rolston, Holmes, III, "The Bible and Ecology" Interpretation: A Journal of Bible and Theology 50 (no. 1, January 1996):16-26. The Bible is not a book of science, and therefore not of ecology. It does, however, sketch a vision of human ecology, and contemporary readers encounter claims about how to value nature. The Bible's vision is simultaneously biocentric, anthropocentric, and theocentric. The Hebrews discovered who they were as they discovered where they were, and their scriptures can be a catalyst in our ecological crisis.

Rolston, Holmes, III, "Technology versus Nature: What is Natural" in CPTS Ends and Means: Journal of the University of Aberdeen Centre for Philosophy, Technology & Society 2(no. 2, Spring 1998):3-14.

This journal was intended to be principally an electronic journal:

<<http://www.abdn.ac.uk/cpts/techno.htm>>

However, it was printed twice a year (University of Aberdeen, Old Brewery, Old Aberdeen, Scotland

AB24 3UB, UK.) Currently lapsed publication.

In some meanings "nature" includes everything and thus includes technology. In other meanings "nature" refers only to spontaneous or wild nature and excludes all artifacts of culture, including technology. Nature continues environing culture; culture is always construct out of, superposed on nature. Natural is often also a normative term, while artificial is pejorative. A prevailing philosophy is that humans should become the planetary managers. This has become increasingly possible with the transition from muscle and blood to engines and gears, from about 1850 onward, coupled with the information explosion more recently, which have brought an epochal change of state, and makes a postnatural world possible. To some extent this is inevitable, though not wholly desirable. Significant areas of the planet are still relatively natural, and these areas might become increasingly humanized. Both appropriate respect for nature and moral responsibility require significant conservation of nature. Technological humans are still in search of a sustainable relationship with nature. Finally, there is a sense in which once and future nature is never at an end, since, when humans vanish, nature returns. Rolston is in philosophy at Colorado State University. (v9,#1)

Rolston, Holmes, III, "Naturalizing and Systematizing Evil." Pages 67-86 in Willem B. Drees, ed., Is Nature Ever Evil?. London: Routledge/Taylor and Francis, 2003. Negative evils (disvalues, rather than moral evils) in natural systems, though real enough to fauna and flora adversely affected, must be fitted into an ecosystemic and evolutionary framework. Over the epochs of natural history, Earth has proved a positive value-generating and life-supporting system. A characteristic feature is both the conservation of life and the generating and testing of novel life forms. Life is perpetually renewed in the midst of its perpetual perishing, resulting in the remarkable biodiversity on a fertile Earth. Such genesis is always by conflict and resolution. More provocatively put: Earth is a land of promise, where there is cruciform creation. Rolston is in philosophy, Colorado State University.

Rolston, Holmes, III, "God and Endangered Species," in K. C. Kim and R. D. Weaver, eds., Biodiversity and Landscapes (New York: Cambridge University Press, 1994) Also in Lawrence S. Hamilton, ed., Ethics, Religion and Biodiversity (Cambridge, UK: White Horse Press, 1993), pp. 40-64. Endangered species have religious value for many Americans. Although religious value is not mentioned in the Endangered Species Act, it soon appears in the nickname for the "God Committee." Biologists and religious persons share a concern for conservation, respect for life passes over into reverence for life. Although Bible and theology are at times thought to be difficult to join, apart from the question of design (a somewhat archaic concept), creativity is evident in natural systems as Earth brings forth swarms of creatures. Biologists find struggle in nature, but such elements are fully recognized by Bible writers who lived closer to nature than often do we modern persons. The continual redemption of life over generations is a familiar theological idea. Biologists may not find a supernature, but they often find a nature that is superb, a nature that is the ground of our being. Life is a kind of gift; the plenitude of being in the myriads of species once so vast and now vanishing is of concern both to biologists and to religious persons. (v5,#2)

Rolston, Holmes, III, "Enforcing Environmental Ethics: Civic Law and Natural Value." Pages 349-369 in James P. Sterba, ed., Social and Political Philosophy: Contemporary Perspectives (London: Routledge, 2001). How far ought environmental values be enforced by legislation? Although caring and virtue may be preferred over law-like ethics, enforcement is more widespread than often recognized, extending from Acts of Congress to lighting campfires. The environment is a commons and this necessitates our acting in concert, with enforcements ranging from incentives to penalties, prison, even death. Environmental ethics needs and stands in some tension with democracy. Legislation ought protect animals, species, and ecosystems. Ought it ever defend these against basic human interests? Can such legislated ethics function internationally, as with a universal human right to a quality environment? Rolston is in philosophy at Colorado State University. (v.12,#3)

Rolston, Holmes, III, "The Future of Environmental Ethics," *Teaching Ethics* (Society for Ethics Across the Curriculum):8(Fall 2007):1-27. Environmental ethics has a future as long as there are moral agents on Earth with values at stake in their environment. Somewhat ironically, just when humans, with their increasing industry and development, seemed further and further from nature, having more power to manage it, just when humans were more and more rebuilding their environments with their super technologies, the natural world emerged as a focus of ethical concern. The environment is on the world agenda, also on the ethical frontier, for the foreseeable future. (1) A Managed Earth and the End of Nature? (2) Global Warming: Too Hot to Handle? (3) Human Nature: Pleistocene Appetites? (4) Sustainable Development vs. Sustainable Biosphere. (5) Biodiversity: Good for us/Good in itself. (6) Earth Ethics. Download/Print in PDF format:

Rolston, Holmes, III. "Mountain Majesties above Fruited Plains: Culture, Nature, and Rocky Mountain Aesthetics." *Environmental Ethics* 30(2008):3-20. Those residing in the Rocky Mountains enjoy both nature and culture in ways not characteristic of many inhabited landscapes. Landscapes elsewhere in the United States and in Europe involve a nature-culture synthesis. An original nature, once encountered by settlers, has been transformed by a dominating culture, and on the resulting landscape, there is little experience of primordial nature. On Rocky Mountain landscapes, the model is an ellipse with two foci. Much of the landscape is in synthesis, but there is much landscape where the principal determinant remains spontaneous nature, contrasted with the developed, rebuilt landscape in which the principal determinant is culture. Life in the Rockies permits both use and admiration of nature (fruited plains), with constant reminders (mountain majesties) that the human scale of values is rather tentatively localized in a more comprehensive environment. Rolston, III, Holmes, "F/Actual Knowing: Putting Facts and Values in Place," *Ethics and the Environment* 10(no. 2, 2005):137-174. Knowing needs to be actualized, an act of ours, yet also a discovery of what is actually, factually there. How do our facts depend on our acts? Do we humans always put in place, or sometimes find put, placed there before us, what we variously value on Earth? We are embodied, knowledgeable persons, subjects placed among objects. We need grounds (though not "foundations") for our beliefs. In place ourselves, we manage some awareness of other places. Agents in our knowing, we co-respond with Earth, and this emplaces us. But we humans have powers of dis-placement too, of taking up, whether empathetically or objectively, the situations of others, other humans, sometimes others than humans. Our human genius both requires and transcends location. Surrounding ourselves, we find values in fact and this generates ethics en-acted. Rolston is in philosophy, Colorado State University, Fort Collins. (Eth&Env).

Rolston, III, Holmes, "Duties to Endangered Species." Bioscience Vol. 35, no. 11 (December 1985):718-726. An excellent paper by one of the leading theorists in environmental ethics. Rolston reviews the inadequacy of current ethical theories based on individual rights, sentience, or personhood, to insure species preservation. He then argues that species ought to be protected as "dynamic life forms preserved in historical lines" (p. 722). The species line is more important than individuals. (Katz, Bibl # 1)

Rolston, III, Holmes. "Environmental Ethics in Antarctica. "The concerns of environmental ethics on other continents fail in Antarctica, which is without sustainable development, or ecosystems for a "land ethic," or even familiar terrestrial fauna and flora. An Antarctic regime, developing politically, has been developing an ethics, underrunning the politics, remarkably exemplified in the Madrid Protocol, protecting "the intrinsic value of Antarctica." Without inhabitants, claims of sovereignty are problematic. Antarctica is a continent for scientists and, more recently, tourists. Both focus on wild nature. Life is driven to extremes; these extremes can intensify an ethic. Antarctica as common heritage transforms into wilderness, sanctuary, wonderland. An appropriate ethics for the seventh continent differs radically from that for the other six. Environmental Ethics 24(2002):115-134. (EE)

Rolston, III, Holmes, "Das berücksichtigen, was Singer als belanglos ansieht." In German. Natur und Kultur: Transdisziplinäre Zeitschrift fuer oekologische Nachhaltigkeit. 2(no. 1, 2001):97-116. A translation of "Respect for Life: Counting what Singer Finds of no Account, in Jamieson, Dale, ed., Singer and His Critics (Oxford: Blackwell, 1999), pp. 247-268. Abstract: Singer's ethics is inadequate as an environmental ethic. Beyond the higher animals Singer insists that 'there is nothing to be taken into account'. But most of the biological world has yet to be taken into account: myriad other animals, plants, species, ecosystems, and the global biosphere. Singer can count everything else only instrumentally with reference to higher animals. From a biological point of view, this is little better than humans valuing everything else, higher animals included, as their own resources. A deeper respect for life must value life more directly. (v.12,#2)

Rolston, III, Holmes, "Caring for Nature: What Science and Economics Can't Teach Us but Religion Can," Environmental Values 15(2006): 307-313. Neither ecologists nor economists can teach us what we most need to know about nature: how to value it. The Hebrew prophets claimed that there can be no intelligent human ecology except as people learn to use land justly and charitably. Lands do not flow with milk and honey for all unless and until justice rolls down like waters. What kind of planet ought we humans wish to have? One we resourcefully manage for our benefits? Or one we hold in loving care? Science and economics can't teach us that; perhaps religion and ethics can. (EV)

Rolston, III, Holmes, "Values Gone Wild." Inquiry 26 (1983): 181-207. Humans should not view wilderness as a resource for the production of human satisfaction. Rather, wild nature is a source of human value, as well as the place where we encounter similar beings ("neighbors") and different beings ("aliens") whom we recognize as the possessors of intrinsic value. Wilderness is valuable because it is a "storied achievement" important to human life and culture. (Katz, Bibl # 1) Also in Susan Armstrong and Richard Botzler, eds., Environmental Ethics: Convergence and Divergence (New York: McGraw-Hill, 1993), pages 56-65. Also in Rolston, Philosophy Gone Wild.

Rolston III, Holmes. "Perpetual Perishing, Perpetual Renewal." *The Northern Review* Number 28 (Winter 2008): 111-23. *The Northern Review* is published at Yukon College (Canada). Darwinian nature is in dialectic: conflict and resolution. Human life evolved out of such dialectical nature. If that began in Africa, it continues when humans migrate far North. Religious encounters with such nature, whatever their differences with Darwinism, also find that life is perpetually renewed in the midst of its perpetual perishing. Life is ever "conserved," as biologists might say; life is ever "redeemed," as theologians might say. In this generating of new life, nature is cruciform, beyond the dialectical. Such processes, set in their ecological settings, perennially transform disvalues in nature into prolific values, generating the global richness of evolutionary natural history and its exuberance of life. Such somber beauty in life is nowhere better exemplified than in boreal and Arctic nature. Online at: <http://lamar.colostate.edu/~hrolston/Perpetual-perishing.pdf>

Rolston is in the Department of Philosophy at Colorado State University.

Rolston-Rollin Debate. 50 minutes. A debate before a Colorado State University introductory philosophy class, November 1989. Bernard Rollin defends duties directly to sentient animals only, with other components of the environment having only instrumental value. Holmes Rolston defends an ethic of respect for all forms of life, flora as well as fauna, including ethical concern at the level of species and ecosystems. Includes questions from class members. For a DVD copy for \$ 10, contact Holmes Rolston, Department of Philosophy, Colorado State University, Fort Collins, CO 80523. Phone 303/491-6315. (v1,#1)

Ronald Sandler, "An Aretaic Objection to Agricultural Biotechnology," Journal of Agricultural and Environmental Ethics 17(2004):301-317. Considerations of virtue and character appear from time to time in the agricultural biotechnology literature. Critics of the technologies often suggest that they are contrary to some virtue (usually humility) or do not fit with the image of ourselves and the human place in the world that we ought to embrace. In this article, I consider the aretaic or virtue-based objection that to engage in agricultural biotechnology is to exhibit arrogance, hubris, and disaffection. In section one, I discuss Gary Comstock's treatment of this objection. In section two, I provide an alternative

interpretation of the objection that more accurately reflects the concerns of those who offer the criticism than does Comstock's standard interpretation. In sections three and four, I assess the objection. I argue that despite its merits, the objection does not justify global opposition to agricultural biotechnology. Instead, it favors a limited endorsement position not unlike the one defended by Comstock. Keywords: agricultural biotechnology, aretaic objection, Gary Comstock, humility, limited endorsement, virtue ethics,

Rosa, Humberto D., and Jorge Marques Da Silva, "From Environmental Ethics to Nature Conservation Policy: Natura 2000 and the Burden of Proof," Journal of Agricultural and Environmental Ethics 18(2005):107-130. Natura 2000 is a network of natural sites whose aim is to preserve species of interest to the European Union. The underlying policy has received widespread opposition from land users and received extensive support from environmentalists. This paper addresses the ethical framework for Natura 2000. Arguments for and against were classified according to "strong" or "weak" versions of the three main theories of environmental ethics--anthropocentrism, biocentrism, and ecocentrism. Land users seemed to fall between weak and strong anthropocentrism. Natura 2000 achieves a strong reversal of the burden of proof from conservation to economic development and land use change under anthropocentrism. The alleged theoretical divide between anthropocentrism and non-anthropocentrism in relation to the burden of proof does not seem to hold in practice. Weak versions of anthropocentrism, biocentrism, and ecocentrism are likely to converge extensively in respect to nature conservation measures. The authors are in biology, Universidade de Lisboa, Lisboa, Portugal. (JAEE)

Rose, Chris, "Beyond The Struggle For Proof: Factors Changing The Environmental Movement." Environmental Values Vol.2 No.4(1993):285-298. EDITORS' NOTE: This article is a new and politically significant statement by a key figure in one of Britain's best-known environmental organization, Greenpeace UK. Chris Rose is a leading environmental campaigner, who has recently piloted landmark changes in Greenpeace's approach to environmental campaigning, for the 1990s and beyond. His account of these changes appears here in print for the first time. ABSTRACT: Until the 1990s environmental non-governmental organizations focused on 'issues' to raise public awareness. Recently it appears that though awareness of environmental problems has increased, the high media profile and superficial

'greening' of politics and business have actually exacerbated people's feelings of helplessness and detachment. Greenpeace UK is currently addressing its strategies to counter this change. KEYWORDS: Environmentalism, Greenpeace, media, non-governmental organizations, risk. Programme Director, Greenpeace UK, Canonbury Villas, London, N1 2PN, UK.

"There is no such thing as a 'natural' landscape." There is no wilderness. There is no place in Australia "where the country was not once fashioned and kept productive by Aboriginal people's land management practices" (p. 19). Rose, an anthropologist, is with the North Australia Research Unit of the Australian National University, Canberra. (v7,#4)

Rose, Deborah Bird, Nourishing Terrains: Australian Aboriginal Views of Landscape and Wilderness. Canberra, ACT: Australian Heritage Commission, 1996. 95 pages. ISBN 0 642 23561 9. Features Aboriginal peoples explanations, stories, poetry, songs, song-poems, reflecting Aboriginal identity and history on the Australian landscape. Were Aboriginals conservationists? Some say no, for there were wasteful practices and extinctions by the Aboriginals. Some say yes, since they had little destructive impact on the land, compared to the Europeans. There is much to learn from Aboriginal people about land management with fire, about the species of the continent, about their interrelationships, about seasonal forces, about how to understand human society as part of living systems, taking humanity seriously without making it the center of creation. Australians are perhaps the most ecologically conscious people in the world, and nowhere else in the world are there greater possibilities for the regeneration of ecosystems, and for the development of a truly coherent relationship between human and ecological rights. Aboriginals and Europeans need to develop a sustainable relation to the land together (pp. 1-5, pp. 83-84). Rose is at the North Australia Research Unit, Australian National University, Canberra. Rosegrant, Mark W., and Cline, Sarah H., "Global Food Security: Challenges and Policies," Science 302(12 December 2003):1917-1919. "Global food security will remain a worldwide concern for the next 50 years and beyond. Recently, crop yield has fallen in many areas because of declining investments in

research and infrastructure, as well as increasing water scarcity. Climate change and HIV/AIDS are also crucial factors affecting food security in many regions. Although agroecological approaches offer some promise for improving yields, food security in developing countries could be substantially improved by increased investment and policy reforms." The authors are with International Food Policy Research Institute, Washington.

Rosen, Robert, Life Itself: A Comprehensive Inquiry into the Nature, Origin, and Fabrication of Life. New York: Columbia University Press, 1991. 285 pages. Rosen argues that life modeled as mechanism is neither necessary nor sufficient for understanding what life is, despite three centuries of such presumption in science. What is life? "The initial presupposition that we are dealing with mechanism already excludes most of what we need to arrive at an answer." Drawing from biology, physics, and mathematics, he proposes an alternative radically different from mechanism. With lots of mathematics. Rosen is professor of physiology and biophysics, Faculty of Medicine, Dalhousie University. (v4,#2)

The issue of drilling for oil in the Arctic National Wildlife Refuge involved intense lobbying in the Senate. Since the House had approved the drilling and President Bush supports it, the Senate vote would decide the issue. Arctic Power, a multimillion dollar lobbying group funded mainly by the state of Alaska, sent Inupiat Eskimos to Washington to lobby the Senators in favor of drilling (and the economic development it would involve for some Native Alaskans).

Stephen Moore, president of The Club for Growth, a fund-raising group for conservative political candidates, explained why conservatives see arctic drilling as a matter of principle: "There is a belief on the environmentalist side that we're running out of oil, that we have to conserve energy. I'm adamantly

opposed to energy conservation. We're not running out. All we have to do is go out and find it and produce it." The League of Conservation voters, which publishes an annual scorecard of environmental votes, announced that the vote on drilling would count double, calling it a "litmus test on who favors a flawed energy policy that relies on fossil fuels." One Senator who was trying to promote a compromise of limited drilling in the Arctic for tougher fuel efficiency standards gave up when he realized environmental organizations would not budge in their opposition to drilling: "If you told the environmentalist we would end global warming once and for all in return for ANWR, they'd still say no." Rosenthal, Sandra and Buchholz, Rogene A. "Bridging Environmental and Business Ethics: A Pragmatic Framework." Environmental Ethics 20(1998):393-408. In the last few years, some attempts have been made to overcome the disparity between environmental ethics and business ethics. However, as the situation now stands the various positions in business ethics have not incorporated any well-developed theoretical foundation for environmental issues, and conversely, environmental ethics is failing to capture an audience that could profit greatly from utilizing its theoretical insights and research. In this paper, we attempt to provide a unified conceptual framework for business ethics and environmental ethics that can further the dialogue that has recently begun, perhaps bringing it to a deeper theoretical level. The authors are in philosophy and business administration, Loyola University, New Orleans. (EE)

The complex nature of these impacts promises to challenge urban environmental managers worldwide. (v.12,#3)

Rosenzweig, Michael L., "Heeding the Warning in Biodiversity's Basic Law," Science 284(9 April 1999):276-277. Ecology's oldest law is that large areas harbor more species than smaller ones. Recent efforts to mathematize this law. Species-area relationships suggest that because humans have wrested away some 95% of Earth's surface from the world of nature, life faces a mass extinction in three phases. (1) Endemic species. (2) Sink species (those that cannot reproduce fast enough to replace themselves). (3) Rare accidents, such as the introduction of new diseases. "The problem suggests its own solution. The land remains. Share it more generously with other species. Do the research to discover gentler ways to occupy the land, ways to reconcile our uses with those of the many species that also need it to sustain life." Rosenzweig is in evolutionary biology at the University of Arizona, Tucson, also editor of Evolutionary Biology Research. (v.10,#1)

Ross, Lester, Environmental Policy in China. Bloomington, ID: Indiana University Press, 1988. 240 pages. Ross maintains that "exhortation and environmental ethics" (p. 60) have been massively tried in China and massively failed. By this he means that earlier Marxist environmental campaigns, such as those for reforestation, exhorted the Chinese to good environmental citizenship, to do what was in the larger public interest, such as plant trees for future generations, and that, although this resulted in the largest tree planting program in human history during waves of enthusiasm, the tree programs failed because there was no sustained monitoring and interest waned as soon as the enthusiasm passed. The trees died for lack of care. No one owned them; everybody owned them. In contrast, all that will work is programs that appeal to the self-advantage of the person over a foreseeable future, such as woodlot planting for fuel. Somebody owns the trees. Or at least is entitled to the wood and responsible for their care. Incentive changes behavior, not moral exhortation. S. D. Richardson, Forests and Forestry in China, q.v., is not so sure. (China)

Ross, Stephanie, What Gardens Mean. Chicago: University of Chicago Press, 1998. 272 pages. \$ 40.00. Ross ponders our capacity to relate to the natural world through the gardens we create. Garden and art history, philosophy, psychology, and literature, with particular attention to English gardens. "I propose to use this episode [the English garden] in the history of taste as a springboard for investigating important and enduring philosophical issues. ... What sorts of meanings can gardens possess? ... What philosophical and aesthetic theories supported eighteenth-century gardening practice? ... Why isn't gardening considered a full-fledged art today?" Among her other claims, "certain contemporary works of art--earthworks and environmental art--should be viewed as the descendants of the eighteenth-century landscape garden" (Preface). Ross is in philosophy at the University of Missouri, St. Louis. (v.9,#4)

Ross, Stephanie. "Landscape Perception: Theory-Laden, Emotionally Resonant, Politically Correct." Environmental Ethics 27 (2005):245-263. Our primal ability to see one thing in terms of another shapes our landscape perception. Although modes of appreciation are tied to personal interests and situations, there are many lines of conflict and incompatibility between these modes. A religious point of view is unacceptable to those without religious beliefs. Background knowledge is similarly required for taking an arts or science-based view of landscape, although this knowledge can be acquired. How to cultivate responses grounded in imagination, emotion, and instinct is less clear, but advocates are eager to spell out

notions of virtuous exercise and effective schooling. Carlson's science-based theory often gets the most attention because he has refined and defended it over many years, but there is a place in aesthetic nature appreciation for the formal or design elements he dismisses as well as for religious, imaginative, emotional, and ambient responses. To date, the normative aspects of these theories have been presented sketchily at best. Working out these details will chart a way for landscape appreciation to become politically correct. (EE)

Rothenberg, David, "No World but in Things: The Poetry of Naess's Concrete Contents," Inquiry 39(no. 2, June, 1996):225-272. Arne Naess introduced the notion of "concrete contents" to posit that the qualities we perceive in nature are intrinsic to the things themselves, and not just projections of our senses on to the world. This gives environmentalism more credence than if secondary qualities about the environment are considered subjective in a pejorative sense. But the concrete contents position pushes philosophy toward poetry because it suggests that felt qualities are as primary as logic. For a philosophy to justify itself, it sometimes needs to find resonance with qualities outside its borders. Examples are presented from Italian writer Italo Calvino, the music of the Kaluli people of New Guinea, a film by John Sayles, and a poem by Thomas Tranströmer. The concrete philosophical contents of the world are found in the relationships between philosophy and experience, never inside philosophy alone. Rothenberg is at

the Center for Policy Studies, New Jersey Institute of Technology, Newark. (v8,#3)

Rothenberg, David, "The Greenhouse from Down Deep: What Can Philosophy Do for Ecology?" Pan Ecology 7(no. 2, Spring, 1992):1-3. "The philosopher of ecology can only implore you to try to conceive of your self and your purpose not in opposition to an environment which is beginning to fight back, but through the surrounding world which may support us forever if we learn to base our cultures upon ideals that allow the earth to flourish." "It is the idea of nature independent of humanity which is fading, which needs to be replaced by a nature that includes us, which we can only understand to the extent that we can find a home in the enveloping flow of forces which is only ever partially in our control. ... There is no such thing as a pure, wild nature, empty of human conception. The moment we identify it as such, it becomes ours! The minute we call some area of the earth separate from our influence, we are putting human constraints on the environment. We are blocking it out. It is a human thing. Wilderness is a consequence only of a civilization that sees itself as detached from nature. ... This a romantic, exclusive and only-human concept of a nature pure and untrammled by human presence. It is this idea of nature which is reaching the end of its useful life." Rothenberg is professor in the Department of Humanities, New Jersey Institute of Technology. (v3,#4)

Rothenberg, David, "Individual or Community? Two Approaches to Ecophilosophy in Practice." Environmental Values Vol.1 No.2(1992):123-132. ABSTRACT: Should environmental philosophers--or practical conservationists--focus their attentions on particular living creatures, or on the community of which they, and we, are part? The individualist ethos of the United States is reflected in legislation to protect endangered species in which particular species are portrayed as individuals with rights that must be protected. By contrast, the planning of environmental protection in Norway, exemplified by the Samla Plan for the management of water resources, emphasizes the importance of community integrity, where 'community' includes the whole of nature. These differing approaches are considered in the light of moral monism and pluralism, with special reference to Christopher Stone's recent work. Despite their differences, and the reservation that each method inevitably takes a human perspective, it can be hoped that each may contribute to enabling people and political systems to consider nature more seriously. KEYWORDS: Ecophilosophy, Endangered Species Act (US), environmental assessment, moral pluralism, Samla Plan (Norway). 351 Harvard Street, #2F, Cambridge MA 02138, USA.

Rothenberg, David, Hand's End: Technology and the Limits of Nature. Berkeley: University of California Press, 1993. 299 pages. Hardcover, \$ 29.95. Rothenberg offers a radical new look at technology as the fundamental way in which we experience and define nature--the tool as humanity extended. Our view of the natural world has changed continually through history, according to the new ways society has invented to use nature. Tools extend our presence in the world, while reconfiguring nature according to human understanding. As we extend the hand in different ways, we perceive what we can touch anew. The natural world changes, and so do we. Nature emerges as something that cannot

meaningfully be opposed to human civilization. Instead, we need to consider the diverse meanings of nature during the various epochs of human civilization and look at nature as a changing foil for our perceived role in the world. Once aware of the limits that technology reveals, we need then to temper technical progress with ideals that the development of machinery tends to elude. Innovations should not be opposed to the surrounding environment. Instead, we should use technique to make a home in the world. Rothenberg is assistant professor of humanities at the New Jersey Institute of Technology; he is known for his work interpreting Arne Naess. (v4,#3)

Rothenberg, David, and Ulvaeus, Marta, eds., The Book of Music and Nature: An Anthology of Sounds, Words, Thoughts Cambridge: The MIT Press, 2001. A Terra Nova Book. This innovative book and CD, assembled by the editors of the periodical Terra Nova, is the first anthology published on the subject of music and nature. Yoking together the simplicities and complexities of the world of natural sound and the music inspired by it, this collection includes essays, illustrations, and plenty of sounds and music. Celebrates our relationship with natural soundscapes while posing stimulating questions about that relationship. The compact disc includes fifteen tracks of music made out of, or reflective of, natural sounds, ranging from Babenzele Pygmy music to Australian butcherbirds. (v.12,#2)

Rothenberg, David, Is It Painful to Think? Conversations with Arne Naess University of Minnesota Press, 1992. 248 pages, \$ 44.95 cloth, \$ 16.95 paper. This book is in Norwegian as David Rothenberg, Arne Naess: Gjør det vondt å tenke? Oslo: Grondahl og Dreyer Forlag, 1992. Rothenberg presents "the grand old man of natural philosophy in his own words." What emerges is "the personal vision of a life imbued with ecology, which reveals in most human terms how respect for and contact with the natural world can provide a foundation for a total view of the vast problems of humanity and our place in the world." (v3,#2) (Norway)

Rothenberg, David, and Ulvaeus, Marta, eds., Writing on Water. Cambridge: The MIT Press, 2001. A Terra Nova Book. Water links all aspects of our existence. From the politics of watersheds to the romance of turtles climbing up from the sea, from Leonardo da Vinci to Octavio Paz, from murder at a hot spring to the cool facts on liquidation, the writings in this collection flow through all the ways humans encounter this most refreshing of elements. There is a bit of science, some management plans for the protection of water, and plenty of stories, poems, essays, and photography. Here is a fresh way of looking at one of the oldest subjects there is. Rothenberg is in philosophy at the New Jersey Institute of Technology and the founder of Terra Nova, the journal from which these articles are taken. Marta Ulvaeus was an editor of TDR (The Drama Review) becoming the Associate Editor of Terra Nova. (v.12,#2)

Rothenberg, David, Improvisation, Sound, Nature. Athens: University of Georgia Press, 2002. With CD. Music takes us home to a natural world that functions outside of logic, where harmony and dissonance, tension and release work in surprising ways. Music, like wind, is the lungs of the world, and Brownian motion seethes at its heart. (v.13,#1)

Rothenberg, David, and Ulvaeus, Marta, eds., The New Earth Reader: The Best of Terra Nova. Cambridge, MIT Press, 1999. \$24.95. Explores the complex and multifarious ways humanity is loose in the natural world. Find out who really wrote the famous Chief Seattle speech. Read why Jaron Lanier wants to turn us all into giant squid so we can talk to one another without language. Rick Bass travels to the country with the most grizzly bears per square mile: Romania. Gary Nabhan dreams of raven stew. Val Plumwood is half-swallowed by a crocodile and lives to tell the tale and affirm her vegetarianism. Charles Bowden enters Tuna Country in Mexico and struggles to find his way back across the border.

Ray Isle fights with a wild turkey; see who wins. And find out why filmmaker Errol Morris thinks that human dreamers are the most endangered species around. Rothenberg is editor of Terra Nova, and in philosophy at the New Jersey Institute of Technology. Ulvaeus is the associate director of continuing Terra Nova projects at the New Jersey Institute of Technology. (v.11,#1)

Rothenberg, David, Why Birds Sing: A Journey into the Mystery of Bird Song. New York: Basic Books, 2005, Penguin UK. An introduction to the world of bird song that combines the insights of science, poetry, and music. We need all three human ways of knowing to find the fullest understanding of these beautiful, natural sounds which resound around us every spring. Rothenberg begins with his own experience playing clarinet along with birds in the National Aviary, and when he finds that the birds seem to respond much more to his music than he expected, he embarks on a journey from ancient writings on to the modern neuroscience, ending deep in the Australian rainforest where he tries to play along with an Albert's lyrebird, using all he has picked up along the way. "This book is exuberant! Exuberantly intellectual, exuberantly alive. And when you are finished with it the world will seem more alive as well, which is an awful lot for one book to accomplish." Bill McKibben Visit www.whybirdssing.com for excerpts, sound clips, pictures, videos, and book tour details. David Rothenberg is professor of philosophy the New Jersey Institute of Technology.

Routley, Val. "On Karl Marx as an Environmental Hero." Environmental Ethics 3(1981):237-44. Donald C. Lee's "On the Marxian View of the Relationship between Man and Nature" is one of a number of recent attempts to interpret Marxian doctrine in an environmentally attractive way. I argue that Lee does not really succeed, that many of the assumptions of the Marxian theory which Lee still retains are in conflict with a satisfactory environmental ethic and with the current process of revision of the conventional ethic. The central doctrine Lee expounds, the superficially attractive Marxian thesis of unity between man and nature, is attractive only because the real basis of this "unity"--the transformation of nature into a human expression--is not spelled out. Such unity-through-transformation is incompatible with retention and respect for untransformed nature, i.e., wilderness. The Marxian position Lee expounds is environmentally unsatisfactory in many other ways also: it continues to laud the "objectification" of nature, retains a highly homocentric view of man's relation to nature, and encourages human hubris. Other specific elements of the position Lee presents which are in conflict with environmentalism are the doctrine of the historical necessity of the capitalist stage, with its acquiescence in the destructive technology of advanced capitalism, the chauvinistic Marxian material on animals appealed to by Lee, and the treatment of liberation as the maximization of leisure and the minimization of bread labor. To obtain an environmentally sound noncapitalist society it is necessary to discard many central elements of

Marxian doctrine and to move beyond Marx. Val Routley is now Val Plumwood. She resides in Braidwood, Australia. (EE)

Rowe, Sharon and James D. Sellmann. "An Uncommon Alliance: Ecofeminism and Classical Daoist Philosophy." Environmental Ethics 25(2003):129-148. Classical philosophical Daoism and ecofeminism converge on key points. Ecofeminism's critique of Western dualistic metaphysics finds support in Daoism's nondualistic, particularist, cosmological framework, which distinguishes pairs of complementary opposites within a process of dynamic transformation without committing itself to a binary, essentialist position as regards sex and gender. Daoism's epistemological implications suggest a link to ecofeminism's alignment with a situational and provisional model of knowledge. As a transformative philosophy, the cluster of concepts that give specificity to the Daoist notion of transformation offers content and direction for the notion of transformation central to many ecofeminist philosophies. These affinities offer possibilities for developing the relevance of both philosophies to bear upon a theoretical understanding of how we can live in a respectful and sustainable relationship with our natural environment. (EE)

Rowe, Stan, "Eine Erd-Ethik für die Menschheit (article in German). An Earth-based ethics for humanity. Natur und Kultur, Vol. 1/2, 2000, pp. 106-120. Nature in the large sense is Earth, the ecosphere, the source of Life and therefore the best metaphor for Life. Humans are co-evolved parts of nature, and their achievements of language and Culture are derived in many ways from the creative Earth. This ecological fact suggests an ethical imperative: Revere the Earth and its sectoral ecosystems, for their importance is greater than that of any single species. An Earth-ethic--a modern form of Animism--goes beyond humanism and biocentrism, broadening the basis of religious sensibility. (v.11,#4)

Rowe, Stan. *Earth Alive: Essays On Ecology*. Edmonton: NeWest Press, 2006. Included are thirty-three short essays or articles, seven book reviews, and the "Manifesto for Earth" (co-authored with Ted Mosquin) by the Canadian ecologist-philosopher Rowe, recently deceased. Rowe was employed by the Canadian Forestry Service from 1948 until 1967. From 1968 until 1985, he was employed as a professor of plant ecology at the University of Saskatchewan. He retired in 1990 and moved to New Denver in British Columbia. For Rowe, living and non-living ecosystem components are not absolutely divided

from each other, and they claim equal importance.

Rowell, Andrew. "Crude Operators: The Future of the Oil Industry," The Ecologist (1979) 27(no.3 1997):99. Technological advances and the maturity of existing oil fields have spurred oil companies to explore for oil and extract it from previously inaccessible or "frontier" areas, both offshore and onshore, so as not to be totally reliant upon Middle Eastern resources. In many cases, such prospecting and production is having severe environmental impacts and serious social, ethical and cultural consequences. (v8,#3)

Rowlands, Mark, The Body in Mind: Understanding Cognitive Processes, Cambridge: Cambridge University Press, 1999. This book challenges the Cartesian view of the mind as a self-contained monadic entity, and offers in its place a radical externalist or environmentalist model of cognitive processes. Cognition is not something done exclusively in the head, but fundamentally something done in the world. Drawing on both evolutionary theory and a detailed examination of the processes involved in perception, memory, thought, and language use, Rowlands argues that cognition is a process whereby creatures manipulate and employ relevant objects in their environment. It is not simply an internal process of information processing; equally significantly, it is an external process of information processing. This innovative book provides a foundation for an unorthodox but increasingly popular view of the nature of cognition, and a systematic dismantling of the distinction between mental and environmental processes. (v.11,#3)

Rowlands, Mark, Environmental Crisis: Understanding the Value of Nature. Basingstoke, Hampshire, UK: Macmillan, 2000. New York: St. Martin's Press, 2000. 191 pages. Attempts to understand the nature of environmental value founded on an inadequate conception of the nature of mental processes. Critiquing both subjectivist and objectivist accounts of environmental value, the book argues that proper understanding of this nature requires a breaking down of the distinction between mind and world. However, previous attempts to do this, being in the grip of the essentially idealistic trends that have dominated philosophy since Kant, all involve trying to "pull the world into the mind", showing that the world is, in one sense or another, a construction of the mind. This, it is argued, is anathema to environmental thinking. What is required to arrive at a satisfactory account of environmental value is to "pull the mind into the world", that is, to show how mental processes possess, quite literally, have environmental constituents. Rowlands, in philosophy at the University of Ireland, Cork, is transferring to University of London, Birkbeck College. Reviewed by Jennifer Baker in Environmental Ethics 24(2002):321-324. (v.11,#3)

Rowlands, Mark, Animal Rights: A Philosophical Defence, Basingstoke, Hampshire, UK: Macmillan, 2000. New York: St. Martin's Press, 1998. The question of the nature and extent of our obligations to non-human animals has featured prominently in recent moral debate, underlying and informing discussion on topical issues such as factory farming, animal experimentation, and hunting. This book defends the novel position that certain ideas stemming from the social contract tradition in philosophy--the tradition which sees moral rights as deriving from implicit agreements between individuals--can be used to justify the claim that our obligations to animals are far more substantial than we commonly think. Critiquing the rival accounts of writers such as Peter Singer and Tom Regan, this book shows how an influential form of the social contract idea--one deriving from the work of John Rawls--can be used to make sense of and justify the concept of animal rights. Rowlands, in philosophy at the University of Ireland, Cork, is transferring to University of London, Birkbeck College. (v.11,#3)

Rowlands, Mark, "Environmental Epistemology," Ethics and the Environment 10(no. 2, 2005):5-28. "Externalism" in all its forms possesses two essential theses, one concerning the nature of the states to which the externalist thesis applies, and the other concerning the properties of those states in virtue of which it applies. The first thesis is that externalism applies only to the so-called propositional attitudes. It applies to beliefs, desires, hopes, fears, expectations, anticipations, and the like, all of which are (i) attributed to a subject by way of a that-clause, and (ii) are individuated, in part, by way of the proposition that follows this clause. The second thesis is that the externalist claim applies to such states because they possess semantic content; because they are individuated by way of the proposition that follows the that-clause. Externalism doesn't go far enough. I'll try to develop a form of externalism that reaches parts other externalisms cannot reach. This can be called vehicle externalism, but I adhere to my somewhat tendentious label: environmentalism. Rowlands is in philosophy, University of Hertfordshire, UK. (Eth&Env)

Rozzi, Ricardo, John Silander, Jr., Juan J. Armesto, Peter Feinisinger, and Francisca Massardo. "Three Levels of Integrating Ecology with the Conservation of South American Temperate Forests: The Initiative of the Institute of Ecological Research Chirac, Chile," Biodiversity and Conservation 9(no. 8, 2000):1199-1217. Abstract. The diversity of native species assemblages and that of indigenous cultures that once characterized the temperate forests of southern Chile have experienced a process of homogenization ever since the Spanish conquest. Today this process continues to erode both biotic and cultural diversity. With the goal of linking ecological research with actions to conserve the biological and cultural richness of this region, we established the Institute of Ecological Research Chiloe. The Institute's philosophy and activities involve three approaches: (1) participation of professional ecologists in environmental education and decision making, through collaboration with the community at local, regional, and global scales; (2) programs of ecological education, which include planting indigenous trees in urban areas and creating a local botanical garden with representative Chilean forest species; (3) critical analyses of the narrow economic and utilitarian environmental ethics that currently prevail in Chile, and often in other Latin American nations, and examination of traditional or novel alternative ethics and perspectives that address multiple interrelations between biological and cultural dimensions. Key words: biological and cultural diversity, ecological education, environmental values, South American temperate forests, sustainable biosphere initiative.

Rozzi, Ricardo, "The Reciprocal Links between Evolutionary-Ecological Sciences and Environmental Ethics," BioScience 49(1999):911-921. Darwinian evolution and its implications for ecologists and ethicists. This is an important case because (1) the social influences and historical circumstances that led Darwin to formulate his theory have been well examined. (2) Darwinian theory is a foundational basis for both ecology and environmental ethics. (3) Darwinian theory cuts both ways. It can encourage respect for the natural environment by weakening anthropocentrism. But it can also favor patterns of overconsumption and exploitation of the environment by strengthening individualism with ideas of the struggle for existence and natural selection. This paper was first presented at an International Society for Environmental Ethics session at the World Congress of Philosophy in Boston, August 1998. Rozzi is at the Institute of Ecological Research Chiloé, Chile, though currently at the Departments of Philosophy and of Ecology and Evolutionary Biology, University of Connecticut, Storrs. (v10,#4)

Rubel, Alan and Robert Streiffer, "Respecting The Autonomy of European and American Consumers: Defending Positive Labels on Gm Foods," *Journal of Agricultural and Environmental Ethics* 18(2005):75-84. In her recent article, "Does autonomy count in favor of labeling genetically modified food?," Kirsten Hansen argues that in Europe, voluntary negative labeling of non-GM foods respects consumer autonomy just as well as mandatory positive labeling of foods with GM content. We argue that Hansen's arguments are mistaken in several respects. She underestimates the demands of respecting autonomy and overestimates the cost of positive labeling. Moreover, she mistakenly implies that only a small minority of people desire information about GM content. We also explore the extent to which her arguments would apply to the US context. Keywords autonomy - genetically modified foods - GM foods - labeling. The authors are in philosophy, University of Wisconsin-Madison, Madison, WI. (JAEE)

Rubin, Charles T., *Conservation Reconsidered: Nature, Virtue, and American Liberal Democracy*. Lanham, MD: Rowman and Littlefield, 2000. A collection under the auspices of the Political Economy Research Center (PERC), a right-wing think tank pressing for deregulation and private property rights. American's canonical figures in environmental conservation saw preservation and conservation as two sides of the same coin rather than as divergent outlooks on nature.

Rubin, Charles T., "Environmental Policy and Environmental Thought: Ruckelshaus and Commoner," *Environmental Ethics* 11(1989):27-51. Excellent discussion of the role of political and moral values which underlie scientific, technological, and environmental decision-making. An examination of the work of Barry Commoner reveals his utopian optimism in the power of an ecologically-driven technology; he is thus an heir to Bacon. Rubin suggests we need a new sense of values and a new vision of the world to limit our desires and re-define the good. (Katz, Bibl # 2)

Rubin, Charles T., *The Green Crusade: Rethinking the Roots of Environmentalism*. New York: The Free Press, Macmillan, 1994. 312 pages. Environmentalism has changed public attitudes as rapidly and profoundly as any other movement in American history. But environmentalism would do well to drop

their tiresome warnings of impending disaster and instead reexamine their own principles. The acceptance of utopian ideals commonly leads to the most extreme manifestations as the purest approach to those ideals. The unintended consequences of noble intentions can be a green totalitarianism. Analyzes Rachel Carson, Barry Commoner, Paul Ehrlich, E. F. Schumacher and finds a radical project, but doubtful scientific accuracy. Rubin teaches political science at Duquesne University. (v5,#3)

Rubin, Charles T. "Environmental Policy and Environmental Thought: Commoner and Ruckelshaus." Environmental Ethics 11(1989):27-51. A close examination of the major works of Barry Commoner provides insight into some of the assumptions that characterize current environmental debate, particularly over the risk/benefit approach brought to the EPA by William Ruckelshaus. Commoner's analysis of environmental problems depends much more on what Ruckelshaus would call his own "vision of how we want the world to be" than on scientific findings. I trace this vision through Commoner's commitment to socialist political change to a profound belief in the ability of technology to rationalize man's relationship to nature. I argue that this widely shared but utopian perspective hampers the serious consideration of environmental issues, even by those who, like Ruckelshaus, believe that they are presenting an alternative to it. Rubin is at the Political Science department, Duquesne University, Pittsburgh, PA. (EE)

Rue, Loyal, By the Grace of Guile: The Role of Deception in Natural History and Human Affairs. New York: Oxford University Press, 1994. With a chapter extensively detailing the role of deception in natural history, both structural (camouflage and mimicry) and behavioral (hiding, stalking, the angler fish that uses its tongue as a worm, for bait). Animals are repeatedly naturally selected to deceive each other; plants deceive insects; those that can do so survive better, though there is also adaptive value in being able to detect deception. Humans arise in this genetic tradition, and are genetically disposed, in part, to be deceivers. Deception is required in culture, though there is a long cultural tradition that judges deception negatively.

Metaphysically, the natural world is meaningless; nihilism is true. But humans need myths otherwise, and hence the religious and philosophical traditions. Science erodes these myths, revealing these deceptions about nature and within culture. Unfortunately, we need some such myths to survive, else science will prove maladaptive. Nature is objectively valueless, but we need to deceive ourselves into believing in its intrinsic value. We have to be saved from the truth. We need "the saving grace of noble lies." We can only live "by the grace of guile." Rue teaches philosophy and theology at Luther College (Luther College?!), and he seems to have managed to practice the self-deception he preaches; he describes himself as a "theoretical nihilist and an existential biophilic" (p. 278). (v5,#4)

Rue, Loyal, Everybody's Story: Wising Up to the Epic of Evolution. Albany, NY: State University of New York (SUNY) Press, 2000. 176 pages, \$ 17, paper. The traditional stories, myths, ethics, philosophies are becoming more and more irrelevant, but Rue argues that he can replace them with a new story based on fact, the epic of evolution; and everybody and everything gets into the story: every race, every species, every star, everybody. Rue teaches religion at Luther College, Decorah, IA. (v.11,#1)

Russell, A. Wendy, and Robert Sparrow, "The case for regulating intragenic GMOs," *Journal of Agricultural and Environmental Ethics* 21(2008):153-181. This paper discusses the ethical and regulatory issues raised by "intragenics" – organisms that have been genetically modified using gene technologies, but that do not contain DNA from another species. Considering the rapid development of knowledge about gene regulation and genomics, we anticipate rapid advances in intragenic methods. Of regulatory systems developed to govern genetically modified organisms (GMOs) in North America, Europe, Australia, and New Zealand, the Australian system stands out in explicitly excluding intragenics from regulation. European systems are also under pressure to exclude intragenics from regulation. We evaluate recent arguments that intragenics are safer and more morally acceptable than transgenic organisms, and more acceptable to the public, which might be thought to justify a lower standard of regulation. We argue that the exemption of intragenics from regulation is not justified, and that there may be significant environmental risks associated with them. We conclude that intragenics should be subject to the same standard of regulation as other GMOs. Russell is at the School of Biological Sciences, University of Wollongong, Australia. Sparrow is at the School of Philosophy and Bioethics, Monash University, Australia.

Russell, Colin A., The Earth, Humanity and God. London: UCL (University College, London) Press, 1994. 193 pages. ISBN 1-85728-145-4. The present condition and future prospects of our planet, taking into account both the responsibilities of human beings and the over-riding providence of God. A Christian perspective on environmental problems that takes very seriously both the scientific and theological issues. Christians have no monopoly on environmental policy but they do have something to contribute to the solution of environmental issues. "I am persuaded that to discuss the fate of the Earth without reference to God would not only be like playing Hamlet without the Prince; it would also be like acting, producing or criticizing the play without reference or acknowledgment to Shakespeare" (p. 3).

Chapter titles: The Earth in Space; The Earth in Time; Fragile Planet, "Hurt not the Earth"; Foes of the Earth; "Mother Earth?"; Gaia; Surveying the Prospects; Hope for the Earth. Russell is at The Open University.

Russell, Colin, A. *Saving Planet Earth—A Christian Response*. Milton Keynes, UK: Authentic Media, 2008. Russell's book is intended for the church population at large as an introduction and aid to Christian action in the environmental crisis.

Russell, Colin A., The Earth, Humanity and God. The Templeton Lectures, Cambridge, 1993. London: UCL Press, 1994. The Earth in space. The Earth in time. Fragile planet. "Hurt not the Earth" (Science and environmental problems, the chemical industry, nuclear technology). Foes of the Earth (Human ignorance, greed, aggression, arrogance). "Mother Earth?" Gaia (Self-regulating systems). Surveying the prospects. Hope for the Earth (intrinsic value, creation and restoration, human stewardship, divine destiny, a new creation). Russell dislikes materialist science, but equally a postmodernist pantheism with an organismic view of nature, a kind of "return to myth," neither good science nor good theology. Stewardship, combining biblical and scientific outlooks, is the most adequate model. Russell is at the Open University, UK. (EE v.12,#1)

Russell, David, "Forestry and the Art of Frying Small Fish," Environmental Values 7(1998): 281-289. This paper is in the form of a narrative exploration of trees and woods. It embraces both the rational and the non-rational dimensions of experience, and mingles science with a little fancy. It begins by questioning some contemporary attitudes towards woods, then proceeds to consider how they function, it continues with some reflections on the cultural significance of trees and woods, and concludes with some ideas on the implications for woodland management. KEYWORDS: woods, forestry, ecosystem dynamics, significance. David Russell is with The National Trust, UK. (EV)

Russell, Denise, "Animal Experimentation in Psychology and the Question of Scientific Merit," Ethics and the Environment 2(1997):43-52. Nonhuman animals are widely used in psychological research and the level of suffering and death is high. This is usually said to be justified by appealing to the scientific merit of the research. This article looks at notions of scientific merit, queries whether they are as clear-cut as commonly supposed, and argues that with contemporary conceptions it is too easy for any research to count as meritorious. A tightening of the notion of scientific merit is suggested, providing a ground for rejection of certain psychological research. Russell is in philosophy at the University of Sydney, Australia. (E&E)

Russell, Denise, "‘Piracy’ on the High Seas," *Ethics and the Environment* 12(no. 2, 2007):93-116. In "Thinking Like a Mackerel," Susan Power Bratton attempts to develop a sea ethic based on the writings of Rachel Carson. This article critically evaluates Bratton's position using an analysis of a contemporary problem on the high seas as a basis: the theft of the Patagonian tooth fish in the Southern Ocean. Various possibilities for providing philosophical and legal bases for the protection of the sea realm are explored. Russell is in philosophy, University of Wollongong, Australia.

Russow, Lilly-Marlene. "Why Do Species Matter?" Environmental Ethics 3(1981):101-12. One seldom-noted consequence of most recent arguments for "animal rights" or against "speciesism" is their inability to provide a justification for differential treatment on the basis of species membership, even in cases of rare or endangered species. I defend the claim that arguments about the moral status of individual animals inadequately deal with this issue, and go on, with the help of several test cases, to reject three traditional analyses of our alleged obligation to protect endangered species. I conclude (a) that these traditional analyses fail, (b) that there is an important conceptual confusion in any attempt to ascribe value to a species, and (c) that our obligation must ultimately rest on the value--often aesthetic--of individual members of certain species. Russow is in the department of philosophy, Purdue University, West Lafayette, IN. (EE)

Russow, Lilly-Marlene. Review of Animals and Why They Matter. By Mary Midgley. Environmental Ethics 7(1985):171-75.

Russow, Lilly-Marlene. "Ecosystem Health: An Objective Evaluation?" Environmental Values 4(1995):365-369. Some ecologists and philosophers have tried to develop a concept of ecosystem health that would support more 'objective' means of evaluating an ecosystem. I argue (following Dale Jamieson) that the concept of health is itself too subjective to justify such an attempt, and then suggest that part of the problem is that the goal of achieving greater objectivity is itself unclear. I analyse and evaluate three different ways of drawing the distinction between subjective and objective evaluations as a first step towards clarifying that goal. KEYWORDS: Ecosystem health, Jamieson, subjective values, objective values. Russow is in the philosophy department, Purdue University. (EV)
